Yes it will limit the current through the diodes. That is the problem: the current that is not able to flow through the diodes will flow through your RX instead. It is better to remove the resistors in series with the diodes, since the current will do less harm (or less expensive harm) if it flows in the diodes instead of your RX.

You can get very high pulse power rated Zeners, designed for clamping
pulses. They do not call them Zeners though, they call them something
different (TVS? Transzorb?) I think these may have too much capacitance
for 30MHz work.
http://www.vishay.com/diodes/protection-tvs-esd/trans-zorb/

Back in the pre-history of most folks here (like 1940), the old
ARC-5 Command Set Receivers for HF had little neon bulbs
connected in parallel to the high-impedance antenna input.
Being IN aircraft that naturally developed some static
electricity charges on their wire antennas, the bulbs' kept
the static charges from accumulating beyond the (approx)
70 volt bulb breakdown. It was a rudimentary noise
reduction scheme back then.

For receiving or transmitting, a simple 1:1 (or any other
ratio) balun will both DC-ground the antenna and offer
DC isolation between antenna and feedline. Any static
that tries to accumulate on the antenna is quickly
drained away by the DC path to ground.

A 1K to 10K half- to 2-watt resistor at a receiver antenna
input shunted across it will serve to drain away static
electricity charges without seriously changing the antenna
impedance. For a balanced antenna input (like 300 Ohm
line common with TV and FM BC receivers), just use two
of them with the common point to ground.

Static electricity build-up is common on insulated long-
wire antennas in locations with lots of thunderstorm
activity (where I grew up in Illinois, for example). By
itself it could, possibly, pose a danger (certainly a very
rude shock). A continuous drain-away device such as
a balun (preferred) or a resistor will lessen that.

Above all - especially in thunderstorm locations - USE A
LIGHTNING ARRESTER ON ANTENNAS!

Tim, I don't want to sound demeaning about a "clever" response,
but, for the last 30 years or so, "radios" ARE using more and

more "computer" parts. The main frequency-determining components of modern receivers, transmitters, transceivers in amateur radio ARE "computer sub-systems." PLLs and DDSs ARE "digital" and the last part of the "IF" in the newer receivers ARE "digital." So is voice-frequency shaping and compression-expansion and noise reduction.

"Begin with a simple regenerative receiver?" I say a resounding NO to that. All that will be "learned" is assembly and how to fuss around with trying to keep it from becoming a transmitter. NOT a good place to start to "learn" despite the political-correctness and "all the old-timers say that." Nonsense. I'm one of those old-timers and "been there, done that, got lots of T-shirts" in many ways in radio-electronics.

To "begin learning" I would suggest getting an ancient TUBE-type "All American Five" AM BC receiver. There must be tens or hundreds of thousands of those things sitting around unused in attics, basements, etc. It is a basic superheterodyne receiver with simple power supply, a local oscillator (think of it as a "VFO-to-be"), a Mixer, a gain-controlled IF amplifier, a diode detector, and a two-stage audio (low) power amplifier. All the basic building blocks in there on one chassis.

EXAMINE each stage and its interrelationships, play with changing things as clues come into mind from textbook explanations. The "signal sources" are plentiful and no signal generator is needed until the examination gets very detailed. Make a mistake fussing around with one? Not a serious problem. They can be had for nothing from neighbors or family that accumulates old stuff...for nothing usually. Get two or three if possible...old parts for them are getting scarce.

Need progress towards a transmitter? The Hartley oscillator in an All-American Five is an introduction to oscillators and modern "computer age" oscilloscopes can monitor the wave-forms in it. One heckuva lot better than, for example, I had it over 50 years ago. Add a simple, low-power Class C tube amplifier (parts out of a second AM BC receiver) and one has the basic MOPA transmitter (Master Oscillator Power Amplifier). From there it is messing about with crystal controlled oscillators and various keying schemes for OOK CW and old-timer's beloved morse code. :-)

One of the VERY LAST things a beginner should avoid is to jump in with plans to build some kind of state-of-the-art digital transceiver. NOT from it being "made of computer parts" but because what happens INSIDE the "digital" devices is so enormously COMPLICATED that it can present a very steep cliff in a learning curve about "radio." Unless one has a very good theoretical grounding in MANY DIFFERENT circuits and schemes that have led up to such "digital radio" designs, the

best way (to me) is to start with a KIT and learn assembling
the parts. The design has already been worked out. Those
few who bother going into WHY it woks can do so with something
that works after assembly.

Doing what "everyone else" did some 30 to 50 years ago sounds
all nice and homey but is NOT "the best" way to approach radio
in this new millennium. WE are IN the "digital age" and have been
for decades...but the analog circuits are still blended in. We
have
to know how they all interface and the characteristics of all to
make
a whole system work.

A Zener acts like a regular diode in one direction, the Zener is actually a back biased diode that is run into it's reverse breakdown point (over simplification). You could use two Zeners in SERIES to clamp an AC voltage.

I think you should start by giving us some parameters.

1. What kind of receiver are you trying to protect; tube or solid state?

2. Are there any transmitters nearby (ham or CB)?

3. What kind of antenna (long wire, dipole, etc.)

4. Urban or rural environment, nearby AM broadcast facilities?

Some other things that you might consider would be adding a sacrificial fuse in line with the protection, say when the diodes or gas arrestor clamp you could have a 47 pilot lamp wired in series with the antenna to limit the current to diodes.

Source record: 8027

Ok, well, with those thoughts in consideration.. I'm still a bit lost on where to start. I know a local guy who has a SDR-1000 and I read his blog on blogspot. Very interesting. I did all the "googling" on it with a program called WebFerret. There is also GNUradio, and a few other projects going on in SDR it seems.

While tubes are cool, and I am sure very nice low tube count receivers/ transmitters/transceivers could be built as they did ages ago.

Yes, I agree we live in a digital age.. and there are still many analog circuits around. Speaking of which, from just having purchased a copy of the 1985 ARRL Handbook today and having glanced through it. (I like old books to begin with).

Quote: "I don't know much about the book in question and the radio it builds,
but the parts you name are all computer parts, not radio parts. My gut
advice would be that you not build a computer but a radio :-)"

Well, thats what I intend to do. Well, half and half. Someone has to start somewhere.

I just wish I could rember everything my grandfather tried to teach me at a very young age.
For reference, I'm just about to turn 30. And, I started getting into this sort of thing around 1986.

As someone somewheres else suggested I have limited information, and well, I just need to fill in the gaps.. not nessisarily start all over. I barely know what to do with the probes of a DMM.. in my case a Fluke 8050A..

Well, yes I probably could put together a kit and learn that way. In other words, "I'm just a mentor short of a college thesis."

Oh yea, and I won't attempt to become a RF Engineer / Designer, well.. just yet anyhow. LoL.

Greg

> more "computer" parts.

And I think that's fine. I personally find those parts as detracting from what is interesting about homebrewing, up until you get to say a Software-Defined Radio, or maybe some hamshack accessories that let you use a computer to do clever things with your rigs.

I do feel it's pointless to build computerized gadgets when perhaps an already existing desktop PC can do the same job. Most digital modes beyond CW are really used much more effectively with a CRT than with little microcontroller-based LED displays etc. Little gadgets that turn a desktop or laptop computer from a blank screen into something that usefully interfaces to a radio are plentiful in the ham magazines and are fine projects.

Again, I tried to encourage him to go into SDR's as the cutting-edge of homebrewing.

> "Begin with a simple regenerative receiver?" I say a resounding
> NO to that.

You do have a point, the OP had a pretty kick-ass all-mode SW receiver already. Perhaps a simple rock-bound CW transmitter that could be used once he got his ticket would be a much more interesting project.

But you do correctly deduce that my first ham-band receiver was a regen built by me in 5th grade :-).

Considering that a complete working multimode multi-band (but used) HF ham rig can be bought for not much more than what the ARRL handbook costs new, homebrewing a complete rig is a non-starter for even those who've been doing simpler projects for decades!

So, thinking it over again, I'd like to advise the OP to find a simple CW QRP transmitter project that can be used with his existing receiver after he gets his ticket.

Tim.

IMHO:

>From what I gather, you don't have much experience with
practical electronics. If I'm wrong about that, please
correct me. Nothing wrong with inexperience, everyone
starts out that way.

The main problem I see with something like the "Intelligent
Transceiver" is that it is a very big thing to do as a first or
even second project. Not that it can't be done, just that I
cannot recommend it as the way to get started. It's just
too big and complex for a beginner.

I recommend that you look around for a simple receiver
or transceiver project to build. There are many designs
on the web, and kits too. Most are single-band projects
built around a handful of parts, yet capable of usable
performance with a decent antenna. You can learn a lot
from building one and getting it to work, and then move on
to something more complex. In some cases ready-made
PC boards are available, but you have to provide the parts
and enclosure.

You will need some tools, test equipment, and a proper
place to work. One of the advantages of kits is that the
required tool kit is greatly reduced, but so is the amount
of creativity and craft you put into the project.

Look around the internet and your Handbook for a simple receiver or
transceiver project to build for a start. It doesn't
have to use the latest technology in order to work and teach
you many things about radio. Note too that many transceiver projects
can be built as receivers by simply leaving the transmit components
out until later.

Another poster here advised you to build a simple regenerative
receiver. This is excellent advice, because
a regen is about the simplest practical SW receiver you
can build that will give useful results. It will also teach you
a lot about construction technique and operating skill. It
will also make you appreciate a superhet!

The advice to study an "All American Five" receiver, OTOH,
is very bad, for a number of reasons:

1) You want to build, not take apart. In theory you could take an AA5
all apart and put it back together again, but
that's not the same as building something new.

2) There is a good chance that if you can find an AA5, it
will need to be fixed to make it work. While you can learn
a lot that way, it's still not the same as building something new.

3) The end result of any such effort is going to be a basic receiver
for AM broadcast. Not a transmitter or transceiver, and not a piece of
amateur radio or SW equipment. If amateur radio/SW is your interest,
it seems to me that your projects should be for amateur radio and SW,
not AM BC.

4) AA5 receivers are of transformerless, "AC-DC" design. Usually one
side of the AC line is directly connected to the chassis. If the plug

is put in the socket one way, the chassis is connected to the neutral wire, but if it's plugged in the other way the chassis is hot-to-ground by the line voltage! Such receivers were almost always built in cabinets of insulating materials such as wood or plastic, and the chassis made inaccessible, because of the shock hazard. But in order to work on one, you want it out of the cabinet and powered up.

Working on one requires a lot of extra precautions to avoid getting a shock. Better to focus on transformer-operated equipment whose chassis can be directly grounded to minimize the shock hazard.

Tubes or transistors? They're both fun, and both have advantages and disadvantages. Solid state parts are generally more available new or new-old-stock (NOS), though.

Google my callsign to see some of my homebrew efforts.

And keep asking questions!

Hello Pete,

Thank you for your reply, and for the questions. My RF amplifier (HF) is solid state, and there is a Ham transmitter two doors down on the same side or the street I live on (urban environment) but no other AM transmitters *that I know of* in the vicinity. I live on the industrial side of town however, and imagine that there probably are some for the various trucking companies etc. which operate within five or ten miles of my home. The antenna is a longwire, consisting of approximately 100' of four (insulated) parallel strands of #24 AWG copper wire running along the ridge-vent of my house. This feeds into another 60' or so of RG-59 coax to shield against noise from the A/C compressor on that side of the house. It is grounded both where it comes off the roof and again where it comes in my window with 10' copper-clad steel grounding rods driven into the moist earth. The RF

amplifier is a home-brew version of the MFJ 1020-A, using an air-gap (I hope I have this right) transmitter style variable capacitor for tuning, and has a 630V .1uF capacitor salvaged from the guts of an old TV connecting the center conductor of the coax to this tuning capacitor. I do not know the internal composition of this .1uF capacitor, but assume (hate that word) it is compatible with RF applications since it came out of the RF circuitry of a TV. I used to have a .22uF 50V polyethylene capacitor in its place, but that got blown, alerting me to the possibility of static charges coming down the feedline. Since my antenna is a longwire on the roof of my house, and it does routinely get windy, I imagine static will be an ongoing threat.

You mention that two Zener diodes in series could be used to clamp an AC voltage. Could they be used to defend against static? I have two 5.6V Zeners rated at 5W, and would love to employ them in this endeavor. I also have a couple of standard diodes rated at 600 volts PIV and 1 amp. I was thinking of using these, reversed and in parallel with the neon bulb, to take any voltage over the .6 volt threshold of silicon PN devices to ground. Do you think they would do this if I put them between the center conductor of the coax and ground? I am thinking that the "normal" signal level coming from the antenna would probably be something on the order of a couple hundred microvolts, and would therefore not be enough to drive the diodes into conduction. Does this sound reasonable, or am I way off base here?

Thank you for your time and interest. I really have no idea what I am doing here, but I am trying to figure it out and plan as best I can.

Best regards,

Dave

I would concur with those who suggest you're shooting a bit high for a first project(grin). Don't throw out that book - you'll be ready to build that project soon enough - but you should start with something a bit less ambitious. The "AA5" receiver idea strikes me as interesting but completely 100% irrelevant to modern electronics, both from the design standpoint and the implementation standpoint. Poking around an old transistor radio, on the other hand, might be worthwhile.

Firstly, do you have soldering experience? If not, I would suggest buying a bit of protoboard and a "grab bag" of electronic components for practice purposes. You wouldn't be looking to make any circuit that actually worked - just to develop the skills to reliably make good solder connections. The perfect design isn't going to work if the components aren't connected in the way the designer intended(grin) and solder joint problems can be VERY frustrating to troubleshoot. The ARRL Handbook has a section on soldering that includes pictures of proper joints.

(you really should have a copy of the Handbook)

After you're confident of your soldering ability (and I doubt it would take more than a day or two to get it down right) I would look at a modest kit as a starting point. Ten-Tec sells some direct-conversion single-band receiver kits. They actually do something (grin), (indeed they really do it pretty well) and are about the right size for a first construction project. There are other similar choices out there. A kit like this will also get you familiar with component identification.

When you're ready to start going after the transceiver project, do it in modular steps. Try to work in such a way that you can test each section after you complete it. For example, start with the receiver audio amplifier; it should hum when you touch the input, even if the entire remainder of the transceiver is missing. (i.e. you haven't built it yet!) That way, if something doesn't work (and it won't!) you don't have to search the entire radio for the problem; also, you'll get ego-boosting results sooner!

943. Magnetron as RF transciever

Hello all,

I'm manufacturing from a couple of years all sort of equipment for
research (digestors, plasma generators, etc)using the microwave power
field.
One of these is here: http://incdtim.netfirms.com/digestor_new.jpg
I was thinking I know everything about magnetrons. However some time
ago I've discovered a site where the magnetron was used as CW
transciever using a small power 12/4KV inverter.
Unfortunately I didn't saved those pages and now I would love to see
them again.
Does any of you know about what I'm talking about ?

thank you,
Vasile

>Software-Defined Radio, or maybe some hamshack accessories that let
>you use a computer to do clever things with your rigs.

To paraphrase from an old film, "we have a failure to
communicate?"

A PLL subsystem is essentially ALL digital with the exception
of the VCO itself. It uses "computer parts" and it can take
the place of a dozen or hundreds of quartz crystals, using only
one crystal as THE reference. All the parts are legacy and have
been so for at least two decades.

A DDS SOC (System On a Chip) can do the same, yet yield a much
finer frequency increment, still with quartz crystal stability
and control. It is all digital inside that SOC.

>I do feel it's pointless to build computerized gadgets when perhaps an
>already existing desktop PC can do the same job.

Why tie up a desktop PC to do things that can be done in a
small, dedicated assembly? A PIC microcontroller can be a
stand-alone frequency indicator...as witness to Neil Hecht's
fine products over on AADE. Or, how about a vector wattmeter
such as Larry Phipps' (N8LP) LP-100 unit that will also read
the complex impedance of the load? Or the Palstar ZM-30
antenna analyzer as a self-contained Z-R-X box to 30 MHz?
All enabled with "computer parts." All small, easy to apply
or portable with self-contained batteries.

> Most digital modes
>beyond CW are really used much more effectively with a CRT than with
>little microcontroller-based LED displays etc.

"Effective?" Using a desktop or laptop as an I/O device, and
the internal sound card as an extra digital processor and
A/D, saves BUILDING the equivalent. But, otherwise the PC
has only a larger viewing area and color display capability.

This is the HOMEBREW newsgroup and is about BUILDING at home.

I was trying to focus on the LEARNING aspect of getting
acquainted with the various stages of radios. I picked the
ordinary old table model radio as a representative of such
a LEARNING device for several reasons: There are thousands
of them sitting around in storage, unused, replaced by
newer BC receivers; the "All-American-Five" variety has
every basic stage in it...rectifier, mixer-oscillator,
gain-controlled IF amplifier, audio voltage and output
amplifier, plus tuned circuits; it can be forgiving if one
changes some parts values to see what happens; the RF and
IF stages have frequencies low enough to view with most
modern oscilloscopes. The theory part is very legacy and
can be found in dozens of basic text books. If they are
unused for BC listening now, few will complain if a beginner
tinkers around with it.

>Again, I tried to encourage him to go into SDR's as the cutting-edge
>of homebrewing.

I still disagree. Someone who is only a couple steps up
from crystal detector sets jumping into Software Defined
Radios is making MANY quantum leaps in theory just to get
the PROGRAM working. That program is the heart of SDR...
once there is a processor SOC that can work with the
right frequencies...or A/Ds that work at higher IFs.

Yes, modern cell phones HAVE such things and ICs ARE available
to do RF-to-baseband software-controlled receiver functions.
Ever try to USE one of those in a lab environment? It is
NOT for beginners.

>> "Begin with a simple regenerative receiver?" I say a resounding
>> NO to that.
>
>You do have a point, the OP had a pretty kick-ass all-mode SW receiver
>already. Perhaps a simple rock-bound CW transmitter that could be used
>once he got his ticket would be a much more interesting project.

Naturally using CW now that NO US amateur license requires
a code test? :-(

>But you do correctly deduce that my first ham-band receiver was a
>regen built by me in 5th grade :-).

It's irrelevant WHEN anyone BEGAN getting into the guts
of radios to find out how they worked. The real point
is the HOW of learning, the methods used. Everyone was
a beginner at first.

I built a SW BC regenerative back in 1947 as a teen-ager.
Out of an article in Popular Science. Outside of what
the article text gave, I didn't learn anything but how

to assemble one and solder (which I already knew from
middle-school shop class). I tried "quantum jumping" in
theory on different electronics-radio things back then
but didn't get focussed until entering the US Army and
getting into the Signal Corps. But, that is a personal
experience and isn't for everyone nor even recommended.

>Considering that a complete working multimode multi-band (but used) HF
>ham rig can be bought for not much more than what the ARRL handbook
>costs new, homebrewing a complete rig is a non-starter for even those
>who've been doing simpler projects for decades!

Sorry, but I'll say that is wrong...unless the ARRL suddenly
changed its prices for Handbooks by an order of magnitude.
"Multimode" beyond CW-only? Nah.

>So, thinking it over again, I'd like to advise the OP to find a simple
>CW QRP transmitter project that can be used with his existing receiver
>after he gets his ticket.

It can be checked out BEFORE getting any license...using
it on the bench with a dummy load. That will allow lots
of inspection and playing around with parts values before
connecting it to an antenna. One can do the same with an
AM mode transmitter or FM mode voice transmitter (FM is the
simplest but has to be on VHF and above)...although AM DSB
is frowned upon by the "gentlemen" who occupy the HF bands.

As a LEARNING experience it costs (almost always) nothing.

There must be tens of thousands still sitting around, doing
nothing.

> 2) There is a good chance that if you can find an AA5, it
> will need to be fixed to make it work. While you can learn

I disagree. The only one I've seen "not working" was
already damaged beyond repair. :-)

I will repeat...it is a LEARNING experience. Since it is
working, one can work backwards from that to see what
makes it (or a stage within) NOT work.

> 3) The end result of any such effort is going to be a basic receiver
> for AM broadcast. Not a transmitter or transceiver, and not a piece of

True enough, but such receivers still work by the same
principles that apply to HF or VHF or LF or VLF.

An advantage to using AM BC is the known "signal
sources" in the area. One doesn't absolutely need a
signal generator to check or compare its performance.

> 4) AA5 receivers are of transformerless, "AC-DC" design. Usually one
> side of the AC line is directly connected to the chassis.

I have yet to see one that is so "directly connected to one
side of the AC line." They may exist, but all the ones
I've handled (maybe two dozen all told, different makes
and models) have always used a capacitor to chassis
from one side of the AC mains. As I recall, they all had
UL stickers on them.

> ... But in order
> to work on one, you want it out of the cabinet and powered up.

Yes, but that applies to ALL such things, yes? :-)

> Working on one requires a lot of extra precautions to avoid getting a
> shock. Better to focus on transformer-operated equipment whose
> chassis can be directly grounded to minimize the shock hazard.

Tens of thousands of tinkerers have gone before you and
still survived without being "shocked." :-)

Electricians seem to survive just fine and some of them
work directly with "hot" circuits...at higher voltages than
a nominal 115 VAC. TV repair folks face 24 KV from
picture tube ultors (the final accelerating anode)...even
when the power is off and disconnected.

If all else is troublesome, a cheap 1:1 isolation transformer
can eliminate all those "hazards." Cost in the neighborhood
of $15-$20 for 50 VA. However, even if used, the "B+" is
still at 140 to 100 VDC and is always there when working.
Precautions are fine but let us use a little realism on
"advice" - tube based devices nearly ALL have lethal-
potential voltages present. The average solid-state
device tops out at +/-15 VDC or thereabouts, NOT a
lethal potential.

Google for "Injection locked magnetron" or substitute "phase locking magnetron" and go from there. The link is for one paper on the subject covering phase locking as well as injection locking. Injection locking uses a circulator on the output of the magenetron as a means to inject signal from a stable source.

http://www.vhfdx.net/docs/tahir.pdf

By the way whats a "digestor"?

I never had much luck with Microwave power transformers. They seem to
saturate with light loads and draw several amps of line current. If
the load isn't 600 watts, they go crazy, draw lots of current and
heat up. They also have the laminations welded together which reduces
efficiency (lots of eddy currents). Might be better suited for a boat
anchor.

952. LC Oscillator Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-19 16:23:54 UTC
From: Anthony Fremont <spam-not@nowhere.com>
Message-ID: <12vte9djan9nbe3@news.supernews.com>
Source record: 8041
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

Pictures available in ABSE

The top trace (yellow) is taken between C4 and R2. The bottom trace (cyan) is taken at the base of the transistor. There is a switchercad file, but the simulation will show allot of distortion that really isn't present in the prototype circuit, because of lots of circuit capactance I suspect. R1 was something I was playing with to try and tame the voltage across L1/C3 being applied to the base.

Hello all,

I was tinkering with this LC oscillator (Colpitts/Clapp) this weekend. I arrived at the values of C1 and C2 empirically after starting with a crystal oscillator circuit. The values in the original circuit created a horrid waveform that looked allot like the simulation. After much tinkering around and simulating, I come to the conclusion that getting a perfect waveform is nearly impossible, especially with big swing. It seems that the transistor likes to take a bite out of the right half of the peak of the wave.

What is the secret to beautiful waveforms? Do I need another LC resonator on the output to fix it up? I mean, I'm getting a pretty nice wave now, but there is still some distortion that you can just see at the top of the peaks on the yellow trace.

How do you control the peak voltages of an LC resonattor without mangling the waveform? The waveform at the junction of L1/C3 is of course quite beautiful, how do I get it from there to the output? ;-)

I realize that I will need a buffer stage(s) before I can make any real use of the signal, but I want the input to the buffer to be as perfect as possible.

Thanks :-)

The waveform in a high Q tank that's lightly coupled to the amplifier
should be very nearly sinusoidal. If in addition, the amplifier
remains linear and represents a constant impedance over the whole
cycle of the waveform, then the waveforms should everywhere be
sinusoidal. If the amplifier+tank has barely enough loop gain to
sustain oscillation, then clipping will be minimal, but it's also
possible to detect the level and control the gain of the amplifier.
You could, for example, use a light bulb like HP did in their original

audio oscillator. Beware, though, that best oscillator performance in other regards may not be achieved the same way you achieve lowest harmonic distortion. Be careful that you optimize the right things for your application.

In the work I do, I need to measure distortion, and the generators I use don't have low enough distortion in their outputs to be directly useful. The distortion levels in the "raw" outputs are generally about -40 to -50dBc. I use filters to make things better, and can get to -140dBc distortion levels fairly easily. If it's low harmonic distortion you want, I'd suggest that it may be better to just put a filter on the output of the oscillator that has only moderately low harmonic output, and not worry so much about that aspect of oscillator performance. Filters work well when the oscillator frequency range is about 1.5:1 or less. Much more than that and you'd need to switch in different filters depending on the oscillator frequency.

Cheers,
Tom

Hello Anthony,

1.
Please set the following option to sitch off data reduction/compression
in the result file..

.options plotwinsize=0

2.
You have to set a small maximum timestep in the .TRAN line too.
Maybe a value of 0.01*Period of oscillation if you hunt for very low
distortion.

Can you send me your file (.asc-file and model-file?) to check it?

Best regards,
Helmut

The secret to a beautiful waveform is -- you usually don't need it
straight from the oscillator.

There are a lot of things that you want out of an LC oscillator. Low
phase noise, frequency stability, consistently strong oscillation, pure

tone, etc. Of these, the only two that you can't clean up later in the following amplifier chain is low phase noise and frequency stability. Concentrate on those, & don't sweat the nice waveform.

Frequency stability and phase noise performance are often achieved by intentionally designing the amplifier so the active element operates in class C, without ever going into voltage saturation. This keeps it's drain (or collector) impedance high, yet delivers a large voltage swing to the gate (or base) to keep phase noise low. It also gives you a more or less consistent standing voltage in the tank, which helps the design of the following buffer stages.

If you absolutely positively must tap the World's Most Beautiful Sine Wave off of the oscillator section, consider a parallel-tuned tank that's loosely coupled to the active element. Then loosely couple your output tap to that -- it's your best chance.

After reading the other replies, it seems aparent that the shape of the signal from the first stage is not that critical, it is stability and phase noise that are most important. So, I should put things back where there is clipping to be sure that the oscillator oscillates and then clean up the signal in subsequent stages.

Digester or digestor is a device wich is able to reproduce fast any
digesting process
(like the one inside your stomach) including soil, human tissues,
chemicals etc.

I think the links I saw was one of those:
http://209.85.135.104/search?q=cache:lmKTArGaPb8J:gbppr.dyndns.org/mil/herf/index.html+pha
se+locking+magnetron&hl=en&ct=clnk&cd=81

unfortunetely I can't see only the cache...

Hello Anthony,

The large capacitance of C1 (10nF) has caused an interrupted oscillation.
Please change its value to 1000p and the oscillator will work as expected.
I have also added MEASURE-commands to measure the frequency.
View -> SPICE Error Log

Another method is using the FFT in the waveform viewer.

Best regards,
Helmut

Save as "osc1.asc".

Okay, that certainly explains why all the sample circuits I find don't expend any great effort at creaing a nice sine wave, and none at explaining why. What you say certainly makes sense, especially if there are no really negative consequences of having the oscillator make a "less than perfectly shaped" wave.

Ok, thanks for the information. :-) I did allot of googling but found nothing that explained it like this. I was thinking of building a little single conversion superhet WWV receiver for 10MHz, if I continue with that I'll just concentrate on cleaning it up in another stage.

Some material I read suggested keeping Xl of L1 at ~300Ohms, the series Xc (C3) at ~200Ohms and Xc of C1/C2 at 45Ohms. Do you have any thoughts on that? Right now I have way too much inductance for 3.5MHz by that theory, and judging from other circuits I've seen. <10uH seems to be the going thing for around 4MHz?

I have never seen clipping. These things are supposed to limit in cutoff,
not saturation. As the signal build up, the conduction angle gets smaller
and smaller until the device runs out of gain. That is another way of saying
that the DC value of the gate voltage gets more negative the bigger the
amplitude. This works out automatically with a JFET. You need about 10K -
100K DC resistance from gate to ground. Using a bipolar transistor is not a
good idea.

That sounds more or less right. With a Clapp oscillator the main tank
is isolated by the series cap, so more of the energy is kept in the coil
and C3, and less of it shows up in C1, C2, and the transistor.

If you're driving a balanced mixer you want to have an LO signal that
doesn't have much even-harmonic (2nd, 4th, etc.) energy in it, but for a
casual receiver that's the least of your worries. Since you're
operating at a fixed frequency it may be a good idea to just feed the
oscillator output into a single-tuned resonant circuit to clean it up,
then send it on to the mixer.

I was wondering about the load that a bipolar would present. I will see if
I can find a JFET in my junk pile, thank you. :-)

In some LC oscillators, the amplitude of the oscillation is controlled by a feedback loop. For example, a rectifier can be used to create a DC voltage proportional to the oscillation amplitude on the LC tank, and then an

op-amp can be used to compare the rectifier output signal to a reference voltage. The output from the op-amp can be filtered and then used to control the current in the oscillator core. It is difficult to do all of this in a way that keeps the phase noise low, but given the right simulation tools (e.g. SpectreRF which is rather expensive), good results can be obtained. In particular, a well-defined oscillation amplitude can help to keep the KVCO well controlled, which is useful in PLLs.

Thank you very much. :-) I have now switched to using an MPF102 JFET instead of the bipolar and much less capacitance for C1 (now 470pF). I only get a 2V peak to peak signal out now, but it's quite nice looking.

Ok, I've now put in an MPF102 and changed R3 to a pull-down. I lowered C1 to 470pF and I get a nifty 2V p-p sine wave on the output. It really tamed the tank circuit voltage down as well. Which brings up a question, with the tank now completely DC blocked from Vcc and Vss, where does it get it's energy. I assume that it must come thru the gate. How does that happen? :-? My circuit is much like Figure 1 here, without the diode though: http://www.electronics-tutorials.com/oscillators/clapp-oscillators.htm

The prettiest waveforms come from balanced oscillators. Distortion then
turns up as 3rd 5th 7th etc harmonics which are far less ugly than the 2nd
3rd 4th 5th etc generated by the single ended types. Balanced ALC is also
easier and more effective.
My own experience says that 'prettier' is better. Those oscillators offering
gross distorted outputs also seem to suffer badly in other areas and gross
distortion always causes problems further down the line.
Procuring good quality is a classic black art, one aspect is to allow the
LC just an occasional vague glimpse of the maintaining amplifier. Another is
to cause limiting by use of an amp having a gentle gain change (eg Fet v
bipolar) and the other is ALC. (Or all three together).
Failing that, there is always the cop-out of an output filter :)
john

It comes from the source, through the coupling capacitors -- Cfb-a and
Cfb-b in your link.

I have now changed it to an MPF102 that I've had laying around for many
years. It works great, thanks.
:-)

Glad it worked out. By the way the feedback path is through the capacitive network between source and gate. That would be more obvious in the configuration that uses a tapped inductor, but works the same way. Leaving out the diode was the right thing to do; it just adds to the noise. I don't know what kind of stability and linearity you need, but if that is important, do not use the common type of ceramic capacitors that are meant for bypassing. They are lossy, and their value varies with applied voltage. Use mica, NPO ceramic, or Mylar and similar for larger values.

Without going to the purity levels that Tom requires, I've always found that
bipolars can be used to produce a fairly reasonable "visibly sinusoidal" (see
note) waveform. Follow the oscillator with an amplifier stage which drives a
limiter/clipper, and use that to control a gain element in the oscillator. It's
like the incandescent non-linearity arrangement except the oscillator stage
waveform remains fairly clean.

(Note: Harmonic distortion not readily discernible on a CRO)

I had to play around with this quite a bit to get it running near 10MHz. It seemed to be more picky about the cap ratios than their actual values.

> the same way. Leaving out the diode was the right thing to do; it
> just adds to the noise. I don't know what kind of stability and

I figured that it would cause horrid clipping the way it was installed. I thought maybe the designer intended it to be the other way around to protect the transistor from reverse voltages on the gate, hmm.... always something to keep you guessing. ;-)

I don't really "need" anything in particular, it's just an exercise to try and learn something. I just used the ceramic caps because they were handy. I didn't have a pile of NPO caps laying around. ;-) I d

Time to add a buffer now since the scope probes load it down so badly now. I'm getting 1.1Vpp into the apparent 5M load of two scope probes. It's probably pulled a ton off frequency as well. Let's see.....(removes one probe).....yep, 90KHz rise in frequency after taking one probe off.

I've eventually found some good plots of the frequency responses of
crystals (see below).

http://g4oep.atspace.com/crystal_filters/signal_frequency_crystal_filters
.htm#4)%20Single-Crystal%20Ladder.

This info from G4OEP is about filters, rather than VXOs, but it
graphically illustrates how a crystal can be neutralised in a bridge
circuit, using a small capacitor rather than large inductor. The
capacitor will be the same value as the parallel capacity of the
crystal.

The plots in Figs 9, 10 and 12 also show how the throughput peak moves
around to some extent as the neutralization is adjusted. The circuit is
essentially the same as I used when I was testing a load of crystals to
see if they met spec wrt frequency accuracy and ESR.

You should be able to use the circuit of the single crystal filter
(in-to-out, without the resistive padding etc) as the resonant part in a
VXO, and adjust the neutralization to pull the frequency of oscillation.
It's worth a try.

Ian.

Oscillators have to have gain greater than one at the frequency of
oscillation.

When turned on, the amplitude builds up until something in the circuit
cuts back the gain. In simple oscillators, that "something that cuts
back the gain" is almost always the active device saturating and
distorting its output.

The higher your gain, the more reliable the oscillator starting up,
but also the higher the distortion.

If you take the output not from the output of the active device, but
from a lightly-coupled tank, then you'll see something much more like
the sine wave you were expecting. This is what you see at the L1/C3
junction. But still you'll get lower distortion there if the active

device isn't driven so far into saturation/distortion. And by definition you cannot suck much power out of the L1/C3 junction without decreasing the Q of the tank and making distortion there too.

You can add a few more active devices and not only buffer things but also put a fairly linear AGC in the loop. This still has distortion, but this is done intentionally in a rectifier to derive the AGC control voltage, which is then filtered. The intentional distortion does not have to appear in the output!

Clever use of devices can make the AGC loop quite beautiful. Look at the Wien Bridge or Meacham Bridge oscillators that use a light bulb in the bridge to not only be the loop-control device but also do filtering (thermal time constant of the filament).

It seams reasonable that if I can look at the junction with a scope and the wave looks good, I should be able to tap it with a secondary JFET without destroying it. Yet I see no examples of that being done. I guess it's just easier to accomplish the waveform repair by using a tank on the output of the oscillator and not loading down the primary tank circuit.

Symmetry is a nice word to use where LC resonance is concerned.
Symmetry for the drive and clipping mechanisms.

Have a look at a long-tail transistor pair with cross-coupled
collector-base feedback resistors, and collectors driving a
centre-tapped LC resonant circuit.

A "classic" oscillator with AGC is the Sulzer Oscillator. Very nice
pics and schematics at

http://leapsecond.com/museum/sul25-1/

> > Clever use of devices can make the AGC loop quite beautiful. Look at

For really nitty-gritty stuff about low-distortion oscillators, see
Jim Williams' examples in Linear Technologies appnote AN-43. (Go to
http://www.linear.com/ and do a search for "AN43" without the hyphen).
Most of the examples there are bridges, and distortions in the
sub-0.1% category are achieved AND THEN IMPROVED UPON BY FACTORS OF
HUNDREDS! Also google "Meacham Bridge" and "Wien Bridge".

Tim.

In addition to the low-noise-low-distortion-high-stability URL's I pointed you towards in my other followup, recent ARRL Handbooks have some really clever low-noise VFO circuits using a multitude of approaches, including explicit AGC circuitry. I have been slowly working my way through the cookbook examples and every example has its merits.

In typical ham use, for better or worse, stability and reliability to start-up are often the most important criteria. What you are complaining about when you see a distorted output, is something that is actually a design goal of oscillators that are followed by multipliers.

One very common method over the years of decoupling the frequency-determining tuned circuits from other frequencies generated in a radio is to run the oscillator grid tank at half the output frequency and depend on distorition to make the desired output frequency. In the simplest case a balanced or push-pull oscillator is a "No-No" because you WANT the second harmonic. The electron-coupled oscillator that was in the 50's/60's/early 70's handbooks is a classic design.

Some people worry a whole lot about it. What they worry about,
typically, is phase noise first and stability second. Lack of
harmonics in the waveform are generally lower on the list. That's
because filtering out harmonics is relatively easy, compared with
cleaning up phase noise and stability problems. You can find lots of
articles on minimizing phase noise, but there's also quite a bit of
trade-secret sorts of knowledge whose owners aren't particularly
interested in sharing, understandably. It's far from trivial to get
the phase noise and spurious performance you'll find in the good
commercial signal generators. Good as they are, though, I know of
none that's good enough to be used without harmonic filtering to do
low-level harmonic distortion measurements.

Cheers,
Tom

One thought we've had is to build a SA602/SA605-based fundamental mode Colpitts oscillator (with two capacitors and the crystal) and then tap into the mixer output, leaving the RF intput disconnected. If the mixer does not mix with anything, we will get an amplified/buffered 13.56MHz signal. Would this not work?

Also, I am not clear how to chose the capacitor values for the Colpitts oscillator - there is no guidance in the application notes. I think these values are not critical? Our crystal frequency is 13.105MHz.

A resistor will do as good, a high value of resistance relative to he
impedance of the receiver. I use 100K. The neon bulb can be fun though. I
used to have one attached to a long wire(200 Ft) or so and it was fun
watching it flash during storms.

The images primarily showed how the stopband notch moved around.
So I decided to put it into spice.

Compared to L compensation it does seem to have a benefit as higher
frequency peak. It also is not troubled by the side-effect of
L-compensation as passing lower and higher frequencies than those
around the crystal frequency.

Trying to make the most of the balancing compensation I placed a small
capacitor in series with the crystal. This moves the pass band
frequency up a bit more. But the smaller the series cap, the less
pronounced the peak seems to be. Also the circuits starts to attenuate
more and more. This might cause difficulty in an oscillator setup
where the loop gain should stay more than one.

Also with the balanced compensation circuit, the phase is changed
around the peak frequency. Without series cap around -45 degrees,
climbing to -83 with 12pF. This should be accounted for in the
feedback loop of an oscillator. (A properly dimensioned L-compensated
crystal does not change phase.)

But all in all it might be a (complex) method of shifting the working
frequency up.

989. Turn portable radio into transmitter- can it be done?

Newsgroup: rec.radio.amateur.homebrew

I have more portable radios than I know what to do with and was wondering if I could somehow convert one of them for use as an extremely low-powered AM transmitter for use around my apartment. I need only a range of 10 feet or so and I really don't want to buy any sort of kit as Part-15 regulations in the US prohibit their use but do allow homebuilt units. I had one of those toys called a Wild Planet Radio DJ that was FCC type-approved but it got misplaced in my last move and now my old-time radio shows are just sitting there waiting to return to life on my antique radios.

Or, should doing that prove impractical, how hard is it to learn how to solder? :-)

Oh Wow! You opened up a whole can of worms with this post.

1) What part of Part-15 does not allow kits? I think it only requires low power levels (depends on frequency) and compliance with antenna size restriction (also depends on frequency). You can purchase Part-15 compliant transmitters, Part-15 compliant (supposedly) kits, or could build your own Part-15 compliant transmitter. There is, as far as I know, no formal "Type Approval" process for Part-15 transmitters. If you purchase a pre-built Part-15 compliant transmitter, be sure it contains a label by the manufacturer stating that it complies with Part-15 regulations. If you build a kit, or build something up from a magazine article or your own design, you will be responsible for insuring that it is Part-15 compliant.

2) It would be possible to modulate the internal local oscillator on one receiver and use it as a transmitter to other radios, but that is somewhat complex and does require soldering, component removal, component addition, etc. Again, you would be responsible for insuring that the resulting transmitter device was Part-15 compliant.

3) For local in-house use you only need a few milliwatts of RF power. There are kits available for that, or you could build up your own crystal oscillator and modulator circuit. Just be sure to keep the power and antenna size within FCC Part-15 requirements for the frequency you are using.

4) Ham Radio is not the answer for what you want to do, because ham regulations in the US do not allow "broacasting" (i.e one-way-only transmission) and also do not allow music transmission.

I did that as a kid with tube type radio. I moved the connections to the antenna coil
to replace the first IF coil. I connected the audio to the grid in place of the antenna
coil. You have to re tune the oscillator and antenna coils to be on the same frequency.

On tube type radios this was easy but on newer radios with a circuit board, I don't know.

That reminds me of the Halicrafters S22-R I had upstairs in my bedroom when
a boy.
By clipping a wire on to the IF (1.6 MHz), I was able to listen downstairs
on a MW receiver.

Once I was staying at a holiday camp and was being kept awake by a loud
radio in the adjoining chalet.
I touched the TV aerial lead on the local oscillator of my Murphy portable
and wiped out their signal.
After a while they gave up and switched it off.

I was so pleased with myself I couldn't get off to sleep !

Taking a valve receiver as an example, I suppose the loudspeaker could be
used as a microphone
and the local oscillator amplitude modulated.
Some soldering might be required !

994. For the newbie, a FAQ, "What is _REAL_ Ham Radio?"

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-24 14:30:20 UTC
From: "G.A.Evans G4SDW" <me@privacy.net>
Message-ID: <eu3clr$v5k$1@news.datemas.de>
Source record: 7983
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.amateur.homebrew

A necessary preface.....

(It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery.
However, there still exists the fundamental basis on
which Ham Radio is based, and that will never die.

This FAQ ("What Is _REAL_ Ham Radio?") will
be regularly published and will not be shouted or bullied
down. It is important that those of a technical bent, who
are the natural seed-corn of Radio Hammery and who
gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.)

-----ooooo-----

So,.....What is _REAL_ Ham Radio?

REAL Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years and now encompasses DSP
and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind.

Ham Radio is not CB Radio and has no common ground with it!
Ham Radio is _THE_ technical pursuit for gentlemen; CB Radio

is the name for the operating hobby for those who buy their rigs and equipment off the shelf.

-----ooooo-----

If you are the sort of person who is motivated by a technical interest in how things work; if you took apart malfunctioning clocks, toasters and the like and put them right despite never having seen them working, then a Ham Radio licence is your traditional route! There has never been a shortage of such people, and those who gravitate towards such an interest have always been welcomed into our shacks and their interests fostered. There is not today, nor has there ever been, a need to go out and encourage and press children, children who have never expressed an interest in Ham Radio, to come into our shacks. Such an activity should cause eyebrows to be raised - what normal well-adjusted adults seek the social acquaintance of children?!

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_ to you to exert yourselves to join our fraternity!

>
As a kid I fooled around with radio circuits. I built a solder less breadboard for building and tearing down circuits that had 4 octal sockets and tons of farinstock clips for interconnecting parts. I had quit a few old tubes in the junk box when an old time radio repair man gave me what was left of the contents of his tube caddies.

So I wound an oscillator coil around a cardboard tube from toilet paper and built a Hartly oscillator with a 6F6G running with 300 volts on the plate. It was modulated by another 6F6G choke coupled to the oscillator. So I was running near 1-2 WATTS input. I connected several feet of wire as an antenna to the cathode of the oscillator tube and tuned it to the middle of the broadcast band at an empty spot on the dial. A crystal phono pickup directly drove the modulator tube.

I would put on an LP record and take a transistor radio outside to see how for out it got. It covered the whole block! Probably illegal power, but I never used it long enough for anybody to notice. Without the antenna, I could still hear it anywhere in the apartment house.

It is CB that is the "hobby". Ham radio is a technical pursuit,
a whole-life pre-occupation.

Technology changes, but it is still the essence of Radio Hams to
remain interested in and be motivated by technology.

Well, maybe not a "prelude" but one of our local M3s (now an M0 one, of the many that have moved through the system) built a Wimshurst Machine and some other such beasts.

Few in here were around when the "phono oscillator" was a
consumer electronics product...in the 1940s. :-)

Back then there were few "radios" (AM broadcast receivers)
that had any audio input jack on the back and "records"
(78 RPM discs) were the new thing for the home.
Phonographs (self-contained units) sometimes had such
oscillators...usually one-tube AM oscillators that could be
set to an unoccupied spot on the AM BC band. No wires
to connect! :-)

These were neat little projects for the teener back then, letting them play grown-up "broadcaster." I was one of those for a few days back then...until my Dad, coming home from work, saw my buddy carrying my portable receiver and listening to my voice coming out of it...:-)

Not a technically-difficult task to build one, even very low-power. Today's wireless FM microphone is more complex, although not too much. With transistors or ICs, an AM wireless mike can be made, with battery supply, in most any large microphone enclosure. No mike cable needed.

It's USE is a fad, little more. The FM mike in a Karaoke setup is much more entertaining in a party environment. These "AM broadcast" thingies are good as minor profit devices for kit makers but very limited due to today's [USA] Part 15 limitations.

Evans, knock it off with this crossposting of pretentious
blabbering. Try confining it to uk.radio.amateur or maybe
rec.radio.amateur.misc. It doesn't belong in HOMEBREW
since it is nothing but YOUR OPINION...an opinion which
"we" have all heard for years with little variance in oratory.

If you are "serious" about this "FAQ" then go to the new
rec.radio.amateur.moderated and post. If you dare. :-(

I doubt he could get it past the moderators. It is derogatory towards both
hams and CB operators.

Only in your mind since you choose to view it that way. There are many fine CB operators. However the service has been trashed by the noticeable few. All must then suffer the insults engendered by the few.

I can best deal with the Childish Broadcast (CB) of
the rather silly and infantile child below by re-iterating one of
the threads of the past few days....

"On a daily basis, this NG is a forum seemingly
for escapees from the school playground, with
gratuitous and offensive personal remarks
originating from even those who have not
been part of a conversation and who could have
no reason, other than uncontrolled infantile
emotions, for interjecting as they do.

Is such public and international demonstrations really
the way forward; the way for PR for the future
of Ham Radio. I say, "No!".

I cannot see how something that is a technical pursuit
with traditions of gentlemanly behaviour could
possibly give way to the childish sneering that is
typical of this NG."

I disagree. it is very complimentary towards _REAL_ Radio
Hams. However, it if it is derogatory towards those
who are really no more than CBers-masquerading-as-Radio-Hams
(Possibly callsigns in the "N8" series fall into that category?)
then that is good.

Ham Radio is a technical pursuit for gentleman. Those who think
that they are Radio Hams but send their rigs back for repair are
"CBers-masquerading-as-Radio-Hams", no more, no less.

If you are one in that category, then I apologise that you were misled
into thinking that you are a Radio Ham by others who ought to
have known better. We have such others in Britland in the shape
of the RSCB, "The Radio Society for Citizens Band" an organisation
that provides premises for meetings of the British Citizens Band
Confederation.

Putting this into its correct perspective, this came about
as the result of a malicious and perjurous complaint made
by Brian Reay, M3OSN, and it is at Brian Reay's door
(and now also the RSCB's door) that any complaints of
Bad PR must be laid.

Brian Reay subjected me and my close family members to
a campaign of harassment wherein he published repeated
racially-aggravated pornographic emails to these NG. He
maintained this campaign over a period exceeding two years.
How his sick-minded obsession was ever relevant to Ham
Radio and to these NG has never been established.

Having put up with this for an extended peiod, I then discovered
that not only was Brian Reay a schoolteacher, but he was publishing
his sick racially-aggravated pornographic emails whilst under
training at a Girls' School.

I did no more than to assert the right of reply in defence when I
asserted that no-one with such a sick-minded history of
international publishing should be a school teacher UNDER
ANY CIRCUMSTANCES.

I hold to that view today.

Brian Reay's infantile response to having the tables turned on him
was to make a malicious and perjurous complaint to his fellow
w*nkmasons to allege that I was harassing him rather than the
oher way around which is obvious from the Google archive to
this day.

Mike Gathergood is well aware of these facts, but it must
be apparent to many of you from the way he hangs around
every posting of mine that he is also a sick-minded obsessive.
best ignored.

I have not been able to establish the name and address of the
school in Strood, Kent, where he teaches.

I would be grateful if anyone can furnish this information,so
that I can make representations supported by evidence to
the governors to seek that Brian Reay be dismissed because
of his history of racially-aggravated pornographic publishing.

But with today's microprocessor, DSP and firmware laiden transceivers,
would repair be both possible and cost-effective once the radio amateur
has purchased a SMD rework station and expensive test gear, etc, that
would only be used for the one repair, etc?

cost effective does not matter to these types it is like the code
wars themsleves one can not even the ask the question of cost
effectiveness or anything but follow along in the Archaici Radio
Service

I've done surface mount repairs and /or modifications in the past without a SMD rework station so it can be done. I find it a bit more difficult now due to poor dexterity in my hand but, while I'd not take on a repair for someone else (in case it goes pear shaped), I'd probably have a try on some thing of my own- unless it was very high in value. I've picked up one of those illuminated magnifying lenses and, with practice, you can solder SMD stuff while looking through that. The key thing, assuming you want to replace a component, is to get it off the PCB without damaging the pads. For a multi-legged beast, you can snip the legs and remove them one at a time. A bit of heat on the body of the package will help if there is any glue under it. Ball grid arrays are more of a problem.

As regards the DSP side, if that goes bad the repair is probably more hardware related (ie a bad component) so the firmware doesn't really come into it. I've not checked, but some of the DSP radios may well use one of the "off the shelf" DSP devices that you can get the development environment for. If so, you could write your own code- assuming you Know what you are doing.

That is a bit unkind Mark. Not all amateurs can afford to scrap radios that, in real terms, are beyond economic repair. Equally, "fixing it" is more fun than buying a new one, or maybe paying someone else to fix it.

Fortunately I prefer non-DSP radios and ones where I can effect a simple repair - especially Icom 735 and Yaesu FT747 - simple and reliable sets and very flexible and forgiving with non-fancy aerial systems unlike some modern sets that 'freak out' when a high SWR is presented.

Thinking of adding DSP to the 747 sometime or maybe trying a PC based real-time solution.

Leigh...

Will, the IC756ProIII is a dream and works fine with a simple end fed for
general HF use and a reduced size loaded dipole for 5MHz.

> Thinking of adding DSP to the 747 sometime or maybe trying a PC based

The SDR is a good place to start with this type of thing, there is a wealth
of material around and lots of people experimenting.

Personally, I like a radio with a proper front panel, with knobs you tweak,
switches you push etc.

1026. Anyone used the SA607 or SA608 chips?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-26 02:08:12 UTC
From: btadeyl001@hotmail.com
Message-ID: <1174874892.449600.187540@b75g2000hsg.googlegroups.com>
Source record: 7915

There is surprising little anecdotal information on the web/usenet about the SA607 or SA608 receiver chips. These are similar to the SA605, but run from 2.7-7.0V and have buffered limited output and RSSI's. Has anyone use either of these chips? And if so, can they tell me:

1) How does the SA607/8 performance compared to the SA605 when both are run from a 5V supply? The datasheets show the SA607/8 performing worse (SINAD of -117dBm as opposed to -120dBm for the SA605), but '07/8 are running from 3V while the '05 is running from 6V so it is not a fair comparison.

2) The only difference between the SA607 and SA608 is the later exposes the RSSI buffer amplifier feedback. What it the point of making two different products just for this reason? Is it used to adjust the gain (but this is a buffer amplifier?!)

3) Can anyone tell me what the output looks like of the SA607/8 at pin 9 or 11 (limiter output), meaning, the minimum and maximum voltagea of the 455kHz square wave when there is a strong RF signal output?

It amazes me that about seven analog receiver chips in the SA line are still offered by Phillips (and in-stock at Digikey no less) where so many other companies have discontinued theirs.

Ben

1027. Converting AM signal to FM signal

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-26 07:11:59 UTC
From: ungvichian <ungvichian@thaimail.com>
Message-ID: <1174893119.187241.117880@o5g2000hsb.googlegroups.com>
Source record: 7916

I've seen tons of posts about converting FM signals to AM signals (say, to use with an AM only vintage car radio). But I haven't seen anything about the inverse: converting an AM signal to an FM signal (because there are quite a few FM-only devices on the market now, such as MP3 players). I found this: http://www.uashem.com/pageid-259.html , but it doesn't really fit my criteria. I'd like to be able to tune in any AM station, and then select the frequency to output it to without interfering with other station (think iPod transmitter).

Surely there's gotta be some out there...

Expensive test gear?

Most useful is a magnifying glass to look for dry joints
I'd estimate that 90% of rigs given to me to repair
are resolved by optical examination followed by solder
re-flowing.

Soldering irons - to the bottom of one of your smaller bits,
attach a chocolate box connector (& remove the plastic
covering before it melts and fills the shack with toxic fumes!)

To the other half of the chocolate box connector, attach a
range of obscure "bits" of metal that you've fashioned to deal
with the various SMD shapes. Most Useful is an old Henley
"Solon" bit that has a slot filed in it to sit either side of an
SMD R or C.

"SMD rework station"??? Fashion from bits left over from
your Mecaano set - create an overarm with a spring loaded
plunger to bear down onto the component to prevent
tombstoning. Working end of plunger to be wooden, cocktail
stick or chopstick serves nicely. Sacrificial 'cos slowly
burns away. Only once had a problem with resins oozing
out from wood.

Come on, chaps, this is simple mechanical bodging, a trivial
matter for any self-respecting _REAL_ Radio Ham!
(Unless you fail to secure your PCB before rework,
it ain't "Rock It" Science :-))

"Only used for the one repair"??? Is that a CBer talking? Surely
the essence of _REAL_ Ham Radio is that you're using this
type of equipment all the time? (Not true for a CBer-masquerading-
as-a-Radio-Ham, though!)

"today's microprocessor, DSP and firmware laiden transceivers"? All
REAL Radio Hams thrive on how thing work and how to modify
them!

Indeed, if you're a _REAL_ Radio Ham, then your transceiver will
have been designed, constructed and modified by you, so the
" microprocessor, DSP and firmware" will be your design anyway and
therefore not a problem.

"laiden"????? ITYM "laden". I'd advise you not to seek a job in education
because of that!

Presumably you are thinking about a transmitter like this?
http://www.techfocus.co.uk/iTrip-FM-Transmitters/TFM07.htm
I bought one last week, and it seems to work OK.

I don't think that you can really convert AM to FM in a controlled way,
without going to baseband audio first. I reckon that the regen circuit
you found relies more on 'act of God' or 'green fingers (thumbs)' than
science.

Ian.

Putting this into its correct perspective, this came about
as the result of a malicious and perjurous complaint made
by Brian Reay, G8OSN, M3OSN, and it is at Brian Reay's door
(and now also the RSCB's door) that any complaints of
Bad PR must be laid.

Brian Reay subjected me and my close family members to
a campaign of harassment wherein he published repeated
racially-aggravated pornographic emails to these NG. He
maintained this campaign over a period exceeding two years.
How his sick-minded obsession was ever relevant to Ham
Radio and to these NG, or how it was ever in response
to anything that I had posted, has never been established.

Having put up with this for an extended peiod, I then discovered
that not only was Brian Reay a schoolteacher, but he was publishing
his sick racially-aggravated pornographic emails whilst under
training at a Girls' School.

I did no more than to assert the right of reply in defence when I
asserted that no-one with such a sick-minded history of
international publishing should be a school teacher UNDER
ANY CIRCUMSTANCES.

I hold to that view today.

Brian Reay's infantile response to having the tables turned on him
was to make a malicious and perjurous complaint to his fellow
w*nkmasons to allege that I was harassing him rather than the
oher way around which is obvious from the Google archive to
this day.

Indeed, in the months leading up to his orchestration of my
arrest, Brian Reay chortled on several occasions that he was
deliberately provoking me.

I disagree totally.

There is not now, nor there has there ever been, a need,
desperate or otherwise, to get "new blood".

There are more licensees today than there were in the late 70's
just prior to the influx of CB hobbyist operators.

If the "new blood" propaganda is allowed to develop, we will
end up with a Mongolian Horde of non-techical turnip-brains,
the perception of which by govt agencies will result in a faster
regulation of the technical freedoms we enjoy.

It is far, far better to proceed with technical seed-corn and to
retain our technical privileges, even with reduced numbers.

Why do people continue to propagate this myth? The Amateur Service is not dying, and never has been, and the numbers are not falling. Even the IARU quite clearly state this in their document "SPECTRUM REQUIREMENTS OF THE AMATEUR AND AMATEUR-SATELLITE SERVICES Revised August 2006" at http://www.iaru.org/ac-spec06.html

When referring to the 7MHz allocation, the IARU say "The amateur service requirement continues to be for at least a 300-kHz allocation. This requirement is even greater today than in the past, owing to the increasing number of amateur stations and the expanding diversity of modes of emission used in the amateur service". Note the phrase "increasing number of amateur stations"!

When referring to the 14MHz allocation, the IARU say "The growth of the amateur service and its heavy dependence on this band for international communication....". Note the phrase "the growth of the amateur service".

This doesn't sound like anything that is dying.

The only people who try to propagate the myth that the Amateur Service is dying are those who have a financial interest (national societies through membership numbers and equipment manufacturers/retailers). Don't listen to them. Instead, turn on your radio and listen to that instead.... you will find it is busier than ever!

The latest data available on the IARU website at http://www.iaru.org/statsum00.html (bottom of the page) shows the number of licensed amateurs from 1965-2000. In 2000 the number was at the highest ever, so where is the evidence to back up the 'dying' theory? However, the number of licensed amateurs who were also members of their national society was at the LOWEST number ever (19.6% in 2000 compared to 38.6% in 1965).

There are too many people with no real interest in amateur radio who are continually pushing to have the standards lowered so that they can gain financially from it. They do this by lying through their teeth that amateur radio is dying and use scare tactics that we will lose allocations. It is time to put a stop to this!

--
ARRL membership = $39 (~£20)
RSGB membership = £44

Don't let them rip you off any more.
Do the right thing, resign from the RSGB today.

The RSGB said Radio Amateurs were a threat to national security!
Is this the type of organisation you want to represent you?

The first pre-production pcb has been built and put into service.
Pictures of this board are now available at
http://www.telstar-electronics.com/default_files/NewProductDevelopment.htm
Several other additional boards will be built and put in service
within the next two weeks. After this pre-production pilot... final
adjustments will be made to the pcb to allow for easier/better
manufacturing before the final pcb is released.

P.S. I may be looking for several radio techs in the next few months
that would agree to do some beta testing. Email me with your
qualifications to be considered. The beta units will be free of
charge... and I would only expect a detailed performance report in
return.

The amount of AM being used on 80m is also a very encouraging sign;
seemingly contacts can be had at almost any time, and on any
phone-section frequency. Special nets need not be used to get
contacts, if the onservations of my tuning around are typical.

Where do these occur? I'd like to listen in- or maybe even join in.

I do join an AM net on 160m from time to time (school holidays, it may get noticed if I set up a shack in the back of the class room- although I know of one teacher who did just that!).

>
> Surely there's gotta be some out there...

If you need a small "converter" (of audio), all you need is a
frequency-modulated oscillator, the oscillator tuned to the
FM BC band of your choice. It can be a single transistor
with something like a simple variable capacitance diode (or
equivalent) doing the FM.

The circuit shown in your reference has no magic conversion
and is little more than a jammer of everyone in its tuning
range. If it works at all then it would be by overloading the
input of an FM BC band receiver and forcing it to be a mixer.
That is NOT good homebrewing since the same single-
transistor circuit could be converted to an FMed oscillator
with its output attenuated (to avoid undue radiation) and
loosely coupled to the FM receiver. If you have audio, even
if only from the speaker of an AM receiver, then you have
the modulation source...at audio, something you can hear
to make sure there IS a modulation signal input.

Try 3615 kc/s (UK) and 3705 kc/s (Dutch); both are monitored even when
no activity is apparent. Also look at 3610 - 3640 kc/s.

Other UK nets can be heard in the 3660 - 3690 kc/s section; but AM can
pop up anywhere in the phone section, as people do not necessarily
limit themselves to the regular nets.

The sound of AM rigs is much different to those of SSB equipment even
when the latter operate a form of AM, and military and homebrew gear
have a cachet that modern radios just can't recreate.

Although before your time, it's rather like the situation with 2m
after the war - Monday night was Activity Night, to encourage activity
and increase band usage. That became a success, necessitating
abandonment of the regional sections of the band in favour of a
national system.

There is a thought. We've not got permanent antennas at school yet (although
permission has been obtained and a local has donated materials and effort
for erection there of). At the moment, I use a simple indoor beast for 2m
practice QSOs and an HF inverted V I "throw up" on an ex-MOD mast I have.

The permanent set up isn't in my classroom- the Technology department have
provided the shack space and the roof space for the antennas. The maths
building is a new(ish) specialist block that isn't was tall as the Tech
block- although it probably is better placed for HF antennas.

The pupils respond well to the hobby- I stir some "real world" problems to
maths lessons (eg formulae transposition at the lower end and some of the
higher maths at A level). I've plans for some "code breaking" lessons for
extra maths later this year, they will cover the maths in error correcting

codes etc.

A typical 70's/80's AM transistor radio will have several parts that will be usable (e.g. oscillator coil, tuning cap, lots of small resistors and transistors, an audio amp maybe with output transformer that could be used for modulation) either as raw parts or as subassemblies. But you aren't going to do it without soldering, and probably judicious use of exacto knives too!

Tim.

Big old dish from an obsolete tv microwave system aimed at the city with another one aimed down the hill. Depending on path loses, you may just be able to use two horns from one dish to the other. The first thing to be done is to find what you have to work with at the top of the hill. You need to find the existing signal levels.. IF there is a high mountain toward the side of the signal path you might be able to bounce it off that mountain if it is mostly rock.

have fun.

Cheat. Use a very short extension cord between the UPS and the wall
wart.

Well now, I'm onto bigger and better things.

I was doing a bit of reading lately and came across some interesting topic one being VCO. The VCO I saw used a Optical Shaft Encoder (OSE). The setup used was rather odd looking to me and didn't look that mechanically stable.

Could someone explain VCO to me? And, also what type of VCO would be the best in a transceiver considering the technology of the past 10 years? Are there digital VCO's?

1057. FAQ - - "What is Ham radio"?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-03-29 11:41:41 UTC
From: "G.A.Evans G4SDW" <me@privacy.net>
Message-ID: <eug8lj$3ui$1@news.datemas.de>
Source record: 7946
Cross-posted to: uk.radio.amateur,rec.radio.amateur.misc,rec.radio.amateur.homebrew

A necessary preface.....

(It is becoming increasingly difficult to fly the flag for
decency and for civilised behaviour in Radio Hammery.
However, there still exists the fundamental basis on
which Ham Radio is based, and that will never die.

This FAQ ("What Is Ham Radio?") will
be regularly published and will not be shouted or bullied
down. It is important that those of a technical bent, who
are the natural seed-corn of Radio Hammery and who
gravitate towards us to be the real novitiate, can
still find us, (and know that we are still here), their fellows.)

-----ooooo-----

So,.....What is Ham Radio?

Ham Radio is a technical pursuit for those who
are interested in the science of radio wave
propagation and who are also interested in the
way that their radios function. It has a long-standing
tradition of providing a source of engineers who
are born naturals.

Ham Radio awakens in its aficionados a whole-life
fascination with all things technical and gives
an all-abiding curiosity to improve one's scientific
knowledge. It's a great swimming pool, please dive in!

This excitement causes a wish to share the experience
with ones fellow man, and shows itself in the
gentlemanly traditions of Ham Radio.

Radio Hams are in a unique privileged position in that
they can construct and operate their own equipment! No-one
else has this privilege. Users, such as broadcasters,
the po lice and armed farces, CBers and mobile phone
users have to purchase ready-made gear. Manufacturers
are not licensed to operate their gear. Radio Hams
are qualified to design, build and then
operate their own pieces of equipment. They do this
with gusto, and also repair and modify their own
equipment. This is a privilege well worth the effort
to gain, and one to be jealously guarded.

The excitement that drives a Radio Ham starts with
relatively simple technologies at first, perhaps making
his own Wimshurst machine and primary cells. Small pieces
of test equipment follow, possibly multimeters and signal
generators. Then comes receivers and transmitters. It is with
the latter that communication with like-minded technically
motivated people takes off. The scope for technical
development grows with the years and now encompasses DSP
and DDS. There is also a great deal
of excitement in the areas of computer programming to
be learnt and applied.

The technical excitement motivates Radio Hams to compete
with each other to determine who has designed and manufactured
the best-quality station. This competitiveness is found in DXing,
competitions and fox-hunts.

-----OOOOO----

However, beware! A Ham Radio licence is such a
desirable thing to have that there are large
numbers of people who wish to be thought of
as Radio Hams when, in fact, they are nothing
of the kind! Usually such people are a
variation of the CB Radio hobbyist; they buy their
radios off the shelf and send them back to be
repaired; they are not interested in technical discussion
and sneer at those who are; they have no idea how
their radios work inside and have no wish to find out;
they are free with rather silly personal insults.

-----ooooo-----

One infallible way to disambiguate the CB Radio Hobbyist
from the _REAL_ Radio Ham is to solicit their view of the
difference between CB Radio and Ham Radio. A Radio Ham will
perceive Ham Radio to be a technical pursuit and will
perceive CB Radio to be a social communications facility
no different in essence to a land-line telephone or a
GSM mobile in the hands of a 6-year-old. Thus a Radio Ham
could also hold a CB licence safe in the knowledge that
such a licence says no more about him than having a land-line
telephone, whilst continuing to regard Ham Radio as a separate
technical pursuit.

A CB Radio hobbyist, on the other hand, sees no difference between
a Ham Radio licence and a CB Radio licence. To him, they are
sisters-under-the-skin. Wrongly, the CB Radio Hobbyist then
tries to classify himself as the equal of the Radio
Ham when, in fact, he is nothing of the kind.

Ham Radio is not CB Radio and has no common ground with it!
Ham Radio is _THE_ technical pursuit for gentlemen; CB Radio

is the name for the operating hobby for those who buy their rigs and equipment off the shelf.

-----ooooo-----

If you are the sort of person who is motivated by a technical interest in how things work; if you took apart malfunctioning clocks, toasters and the like and put them right despite never having seen them working, then a Ham Radio licence is your traditional route! There has never been a shortage of such people, and those who gravitate towards such an interest have always been welcomed into our shacks and their interests fostered. There is not today, nor has there ever been, a need to go out and encourage and press children, children who have never expressed an interest in Ham Radio, to come into our shacks. Such an activity should cause eyebrows to be raised - what normal well-adjusted adults seek the social acquaintance of children?!

-----ooooo-----

Please remember that this FAQ is a _POSITIVE EXHORTATION_ to you to exert yourselves to join our fraternity!

A VCO is a Voltage Controlled Oscillator. It's not a different type of oscillator, it's merely some existing type of oscillator with some element changed so a variable voltage will vary its frequency.

What is controlled by the varying voltage depends on the design, but for pretty much all radio type VCOs, a voltage variable capacitor replaces the mechanical variable capacitor.

At it's simplest that means you have an oscillator just like you had before, but you tune it with a varying voltage. So you'd have a potentiometer on the front panel that would supply a varying voltage to that VCO. This oscillator would be no different from the same oscillator with a variable capacitor, give or take how well you regulate the control voltage.

That in itself doesn't do much, other than maybe making the oscillator smaller (the voltage variable capacitor is usually a small semiconductor which obviously takes far less space than a variable capacitor), and in some cases it can be easier to get the parts than find a variable capacitor.

Where they really shine is as part of a PLL, Phase Locked Loop, that locks the VCO to some standard frequency. There, a phase comparator compares the VCO with the standard frequency, and the output of the phase detector is a varying DC voltage that controls the VCO. If the frequencies of the two oscillators don't match, then the control voltage out of the phase detector adjusts the VCO to the exact frequency. By adding circuitry, one can synthesize every single needed frequency, which is where a PLL really becomes useful.

You aren't seeing VCO "controlled by an encoder". The optical encoder is mechanical, and cannot directly control the VCO. (The optical encoder just sends out a stream of pulses, the more pulses the more you turn the knob. And there is a secondary output, also a stream of pulses. The

difference is, one of those outputs goes high before the other; which one is dependent on which way you turn the knob.) You have to turn the pulses from the optical encoder into something else. And in this case, it's being used to control something digital, what would depend on the actual design in the book. One scheme would be it controls a series of up/down counters, and the outputs of them control a variable divider chain in the PLL, between the VCO and the phase detector. Other schemes might have the optical encoder feeding a CPU of some sort, and the CPU does some of the work before controlling something else (such as a variable divider chain, or directly control some other type of synthesizer).

It doesn't have to be mechanically stable, because the encoder is not directly controlling the VCO. It merely supplies information, which way you turned the knob and how far.

One thing to be considering is that the book is intended to be a construction project. It takes the whole book to describe the transceiver, and it's not really about teaching a more general theory. Once you start wanting to change things, you'd be better off starting with some other book, that is less specific, and even shows simpler circuits. Because then you get the background information, and it's far easier to start with a basic SSB transceiver (basic in the sense that it's single band and uses a mechanically tuned variable oscillator), get that going, and then add the "bells and whistles" (done right, you can then replace the VFO with some synthesizer).

Now if that isn't a contradiction! I think the point is all were welcomed,
because they were QUALIFIED. Now we have no-coders who haven't the vaguest idea
of ohm's law, claiming the privileges that were once earned by study and effort.
Lazy slobs like that were not, and never should be, "welcomed."

>Could someone explain VCO to me?

"VCO" is an acronym for Voltage Controlled Oscillator.

The mechanism for tuning is that the frequency-determining
resonant circuit uses (usually) a voltage-controlled
variable capacitor to adjust the oscillatory frequency.
A voltage- or current-controlled variable inductor my be
used to do the same thing. "VCO" has become a rather
generic term applied to any variable frequency oscillator
controlled by a voltage or current. A few mix that up
with "VFO" or Variable Frequency Oscillator, an even more
generic term for a (usually) manually-controlled oscillator.

Typically, the voltage-controlled variable capacitor is
a reverse-biased diode in which the diode junction
capacitance varies dependent on the reverse-bias voltage.
The more rare variable inductor type of VCO changes its
inductance dependent on the amount of DC current changing
its partial magnetic field saturation characteristics.

"Mechanical stability" of a VCO has no direct parallel to
the old-time mechanically-variable manual-tuning variable
oscillator. The fixed components of a VCO require stable
construction, yes, but the frequency stability depends on
the CONTROL VOLTAGE (or current) REGULATION AND STABILITY.

A VCO as a subsystem on an IC may not require any external
capacitance or inductance; some, including component
assemblies in a small enclosure include all of that. An
older form of VCO is the free-running (astable) multi-
vibrator circuit where the square-wave frequency is varied
by bias voltage on the base-gate-grid of the multivibrator.
The demand for digital-IC-based VCO multivibrators has been
slight in the last two decades so most of those have been
withdrawn from production.

"OSE" is not a common acronym for a rotary incremental
digital shaft encoder. [Ocean State Electronics in Rhode
Island uses "OSE" as a logo] A shaft encoder REQUIRES
an interface circuit to convert the directional rotation
digital signals to something that can CONTROL a VCO or
some other circuit producing a controlled, variable-
frequency output. Call it "shaft encoder" for short.

>And, also what type of VCO would be
>the best in a transceiver considering the technology of the past 10
>years? Are there digital VCO's?

Greg, in all fairness to most of the readers of Homebrew,
you are asking questions which are too general, too basic,
and require book-length replies which should have lots of
illustrations to fully explain details. I would suggest
you FIRST engage in some self-study on specific topics to
round-out your own knowledge on circuit basics. I doubt
that most of us want to "explain how to solder" for example
since that is something that can be self-taught on the bench.

Today's transceivers, receivers, transmitters use variations
of the "DDS" or Direct Digital Synthesizer for their main
tuning circuit sub-system. The DDS is a later advancement
on the PLL or Phase Locked Loop, an incremental-step frequency
synthesizer. A DDS (almost always a SOC or System On a Chip)
can produce a much smaller incremental step of frequency.
Both the PLL and DDS use a single quartz crystal oscillator
as the frequency reference; all output frequency steps of a
PLL or DDS are of quartz crystal stability. Most manually-
tuned PLLs or DDSs are set/adjusted by a form of rotary
shaft encoder supplying (through a rotation-sensing digital
interface sub-circuit) the "up" and "down" incremental
frequency step control signals. Frequency display in today's
radios is obtained indirectly from the DDS IC, converted from
the step control sub-circuit output to the DDS output
frequency plus/minus whatever the transceiver needs to make
the display equivalent to the "air frequency" at the antenna.

A DDS is about as close to a "digital VCO" as today's
technology gets...but it CANNOT be explained easily without
lots of text, illustrations, diagrams, knowing some basics
about "digital accumulators" or "analog-digital conversion."
A DDS is RELATED TO, but not quite the same as a PLL.

A PLL uses a voltage-controlled oscillator as its main output.
That output frequency is fed to a variable digital divider
that produces an output that is an integral-division of the
frequency of the VCO. That divider output is compared, in a
phase-frequency detector (digital) to a fixed, stable
reference frequency. That comparison output is filtered to
produce an up/down control voltage for the VCO. In this
frequency-control loop the VCO is maintained on-frequency

to the reference frequency times the number of divisions in the digital divider. Changing the divider increment changes the VCO output frequency. The digital divider increments may be fixed by switches or it may come from another digital sub-circuit that is directly controlled by a rotary shaft encoder for manual adjustment.

The above is a rather basic description of a standard PLL. DDSs have various forms but their control-comparison to a single reference frequency is CONSIDERABLY different from a PLL. A DDS is enormously useful in a modern transceiver, especially in SSB tuning. My new Icom 746Pro, like many modern transceivers, can tune in 1 Hertz steps making SSB reception a snap for clarity...plus having more functions to allow easy digital control of modes like RTTY plus a direct internal interface to its digital signal processing. It uses a DDS as the basic frequency control. My older Icom R-70 receiver used a PLL, actually three PLL sub-systems, to achieve 10 Hertz step tuning, quite good for SSB but not as precise as modern versions. The even older Heath SB-300 family of transceivers used indiidual-band quartz crystal oscillators and mixing with a manually-tuned analog VFO (excellent stability) in a "Collins Radio" architecture.

Now, in all seriousness, if you want to experience learning about transceiver frequency control systems, I'd suggest you concentrate on the old, conventional L-C non-digital all-analog methods. It doesn't have all the high-tech buzzwords attached, but they DID work quite well when attention was paid to certain critical factors in their design/assembly. Basic theory (not just assembling someone else's design) of those will apply to more sophisticated circuit methods. In progression from L-C analog methods to PLLs, one gets to know digital circuitry and how those behave. In progression from PLL to DDS one can get into spectral output and theory of modulation (in general) along with sampling theory and that old devil, "aliasing."

If you start in on self-learning, there is an enormity of material available to you in printed and electronic form. I'd say most of us in RRAH have been there and done that in various areas and ask/discuss more definitive details and comparisons.

Quote: "VCO" is an acronym for Voltage Controlled Oscillator.

Well, yeah I gathered that, after more reading. I see that people have used them in music synthesizer modules.

I'm sorry for being a bit elementary and maybe long winded here, I'm still trying to learn as much as I can while I am doing and reading, etc.

The VCO in the transceiver project in the book used some sort of motor control and shaft encoding.

I did a google type search for HF DDS Generator using WebFerret. Came up with over 175 results. Seems people are using 16F chips and AD98xx chips.

Well, anyhow thanks for all your replies.

Keep that up, by all means. Amateur radio is about radio-
electronics technology applied to communications.

> The VCO in the transceiver project in the book used some sort of motor
> control and shaft encoding.

That's the common method of manual control now...but in-
between the rotary shaft encoder (attached to the manual
knob) and the VCO itself is a large collection of digital
circuits. Be prepared to learn more about digital circuits,
gates, flip-flops, etc. Not difficult, just strange if your
background is only analog circuits.

> I did a google type search for HF DDS Generator using WebFerret. Came
> up with over 175 results. Seems people are using 16F chips and AD98xx
> chips.

Analog Devices is the most-often used supplier of the
basic DDS IC. Microcircuits' PIC series (the '16F'
family) of microcontrollers is used to do the "translation"
between manual frequency data input and the data
needed to set the DDS to the correct frequency. Now
that translation IS more difficult for many, experienced
in electronics or not.

If you are intending to go into frequency synthesizers for
your own projects, I'd suggest you concentrate on PLLs
first. Getting to know those and WHY they work will
lead into the various DDS methods of frequency
generation. The general digital circuits of both PLLs and
DDSs are related.

I helped my CW hearing ability by making a long speaker
box which allowed the speaker element to slide up and down
the length of the box, changing the resonant pitch of the
box, which allows an audio "peaking" effect.
This has the effect of amplifying the cw sidetone at different
pitches and also increasing the S/N ratio. Usually, the QRN
gets lost in the longer travel up the wooden box.

Hi everyone,

I've been getting a lot of stress from my girlfriend. The problem is
jackrabbits. There are a lot of them where we live and at this time of
year
they box each other quite viciously. My girlfriend gets terribly upset
about this and I get nagged as a result. I've tried
to explain to her that it's just nature and they're only establishing
territory for breeding and whatnot and to just let them get on with
it.
However, she won't see reason and insists I do something to break the
fights up. So I
need your help. I've decided the best solution is to build a 'bunny
zapper' type stun-gun. Now it's self-evidently important
NOT TO KILL THE RABBITS, but they must get a shock sufficient to get
the message
across that violence is unacceptable. IMV it should therefore carry
JUST enough
whack to blow their ears clean off. So how much
voltage will this application require? I assume we're talking
kilovolts, but how many?
Does the rabbits' fur resistance affect the calculations?
I have tried researching this on the internet, but it appears no one
has yet
carried out any clinical trials into the problem. So I need you guys
to give me
a ballpark figure. Better yet, if anyone knows of a commercial outfit
that
manufactures stun-guns for use
against jackrabbits can they please post a URL? Finally, is there an
ecologically sound way of disposing of/recycling all the blown-off
ears?
Thanks.

A note to the sceptics:
There is a sound scientific rationale behind my intended approach:
I'm aware that female jackrabbits select their mates primarily by
the length and lustre of the male's ears, so any male with just
a couple of smoking, charred stumps sticking out of his head is
unlikely to
be successful in attracting a mate. In this way, hopefully the
genepool of
the most aggressive rabbits will diminish over time.
Lastly, if we can get the concept accepted into the mainstream as a

legitimate
hobby or sport then maybe we call ALL make a few bucks out of it.
Let's all try to work
together on this one, guys.

pb.

Aren't you talking about hares?

http://www.enchantedlearning.com/subjects/mammals/lagomorphs/Jrabbitprintout.shtml

They may be called jackrabbits in the U.S. but I've never heard of
them being called anything but hares in the U.K.

According to this web-site

http://www.bbc.co.uk/nature/wildfacts/factfiles/192.shtml

the boxers are unreceptive females fighting off males, rather than
males competing for territory, so your girlfriend is going to want you
to able to direct your stun-gun at the male participant, which is
obviously going to be difficult if neither of you has yet realised
that you have been looking at male-female encounters.

A properly programmed image analysis system may be able to do better
than you can in determining the sex of the hares - it turned out to be
relatively easy to set up an image analysis system to sex day-old
chickens, a skill that humans can only acquire after a lot of practice
- but you then have to couple this to some kind of long-range non-
lethal projectile system, like a taser, with a better long range
accuracy than anything I've ever heard off.

It's not a job that I'd take on with any high expectation of eventual
success, and I've got a higher opinion of my own competence than I
have of yours, though this is not an opinion that you will share
(another one of your problems).

What you need is a Border Collie. Besides being a loyal
and beautiful pet, they can be trained (natural instincts)
to herd and escort the bunnies off your property, making
them your neighbors problems. Otherwise, get a Lab,
they will eat the bunnies and again the problem will
be solved.

Hope this helps.

Hey folks,

What is going on with the Russians selling obviously defective
junk and representing it as first quality good merchandise??

Of course there are dubious characters at hamfests but this was
just over the edge this year!!

Stacks of CDR drives, Hard drives, all marked 'bad' somewhere
on them and marked $5 each or in that area. When asked about the
drives and not pointing out that it is already marked as 'bad'
the guy replies in crappy english "I have not tested all of these
but every one I tried has worked". So I go out and drag my laptop
in and guess what??? Five out of five random drives I selected
failed completely. Some didn't even spin up. Are these guys
dumpster diving outside a factory repair center or is this the
stuff we sent over to Russia to have disassembled for the recycle
value? Well I also tried some RAM chips. Again, the very bags
these things were in were marked 'Fails memory test'. The seller
represented them as 'good pull outs'. They couldn't have been any
worse if they had been struck by lightening. It is one thing to
say to the buyer "I really don't know the condition, you're buying
as-is", or "I haven't tested it, but if there is a problem you may
choose a differant one until you find a good one". These guys were
blatently misrepresenting garbage as good useable merchandise!!!
We went through this with the Asian wave, then came the East Indian
wave, now it's the former Soviet block ripoff artists.
I didn't get any business cards from the guys but I wish I had.
These jokers will kill hamfesting by causing folks to think it is
nothing more than a ripoff field-day for the un-suspecting and I
really think these less than reputable folks should be reported
to the hamfest commities.

Caveat Emptor is one thing, but this was just outright lies on the
part of the seller. Pity those who are just starting out in this
hobby and looking for a bargin and get scammed, buy foriegn nationals
at that!!

I did find some Ram for my laptop, a 6C5 vacuum tube, a 'point
and shoot' temperature reading device, some doorknob capacitors,
a 21 pin Cinch Jones male-female pair, and an external floppy
drive for a Thinkpad. All these items were in perfect condition
and the sellers (who were not Russian) were more than happy to
demonstrate the first-rate quality of those items. Hats off to
the rare breed of honest hamfester!!!!

1089. 811A's, Dual Grid and Class B triodes

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-02 12:27:51 UTC
From: shoppa@trailing-edge.com
Message-ID: <1175516871.122672.215880@n76g2000hsh.googlegroups.com>
Source record: 7878
Cross-posted to: rec.antiques.radio+phono,rec.audio.tubes,rec.radio.amateur.homebrew,sci.electronics.components

I was browsing through Terman (2nd edition) last night and read a paragraph about "Dual Grid and Class B triodes". According to Terman, if two concentric (but similar pitch) grids are put in the triode and then connected to each other as a single control grid, the result is a high-mu triode that needs zero bias for Class B operation.

I do not see dual-grid tubes mentioned in Terman's 3rd edition in the same way.

Googling the term, I see that the 52 tube seems to be an example where both grids are brought out to individual terminals.

I also see that sometimes "dual grid" is used to describe RF tubes where there are two pins for a single grid (to decrease inductance I guess), I'm not talking about these tubes.

The two-grids-connected-together characteristics remind me a lot of, for example, the 811A (the most familiar Class B triode I'm familiar with), but that only has a single grid terminal. Am I correct that the internal grid structures of an 811A are essentially that of two connected grids? If not, what inside an 811A makes it zero-bias high-mu class B triode, as opposed to say its externally similar non-identical-twin the 812A (a low-to-medium-mu triode that needs bias)?

I also note that Terman claims that the dual-grid structure forms a very good electrostatic shield between heater and plate, and see that 811A's are often used in grounded-grid connection in RF amps. (Must be a bitch to neutralize in common-cathode).

I've been intermittently playing around with SPICE to model 811A curves (including grid current at positive grid voltage) and none of the conventional triode models work right at all - its curves are more like a pentode (in fact it's pretty trivial to fit it this way if you let the diode characteristics take over at low plate voltage).

Tim.

==========
The #46 is another. The 46 was popular in a number of Atwater Kent
radios circa 1932-33. Class B Push-Pull output stages in high-end
radios had a brief run in the early 1930s, then faded into history. --

Dual-grid tubes were popular for a short while. They were touted as
being versatile -- connect grid 2 to grid 1 and you had a high-mu
triode, connect grid 2 to the plate and you had a low-mu triode.
Judging from my tube data books, it didn't take folks long to decide
they just wanted one or the other, not two in one package.

The curves look pretty triode-like to me, once you take into account the
fact that the thing is running almost exclusively at positive grid
voltages. Perhaps the SPICE triode models aren't taking this into account?

Hi RATs!

I have a huge P-P 46 vintage amp. It is not yet functioning. It is
clearly very well built :)

Grow up, Class "A" does not mean good, it means simple ... which,
despite some journalists' daydreams, is not exactly the same
thing ...

Happy Ears!
Al

A push-pull pair of zero-bias class B triodes is even more remarkably
simple.

When I first saw the schematic of a 811A P-P audio amp, I was
astonished to find not a single resistor or capacitor in the circuit.
Two tubes, input and output transformers, and connections to a
filament supply and a plate supply. That's all there is, folks!

Tim.

I've been going to hamfests for 25-35 years. I've had my share of buying stuff that was said to be good and it wasn't. Or, it was less than what the guy said was what he thought it was. I also bought stuff that worked like it should and like the guy said.

Are you sure your test was under reasonable circumstances? There are lots of hardware incompatibilities, software driver incompatibilities/glitches, and they could have been marked "bad" because someone else didn't test them or install them properly. If you have bad vibes about a deal, don't buy the stuff. If you saw a lot of stuff marked "bad" why didn't you tell them "Hey, this word means it will not work, now why do you think its good?"

I bought computer stuff from thrift stores over the years (monitors and boxes) and 2/3 of the stuff works just fine, the rest goes into the garbage can. In the end, its the price of very cheap computer stuff. 1/3 has to go to the garbage can.

I'd rather concentrate on the overall picture (I was at Timmonium, Saturday) and I thought the tailgater population and the covered space population was down about 20% from what I expected.

Anyone go both days? Hamfests have been in a slow downward trend for about the period when the internet started getting popular.

This is very true and interesting. RCA figured out you could strap the control and screen grids of certain power pentodes and use them as low or zero bias triodes, and a couple of RCA theater amps do this. This is also seen in AM era editions of the W6SAI Radio Handbook for modulators. It is simple. It works. Based on long time experiments it was concluded it doesn't sound very good at all.

I have never tried it, on the theoryu if it worked very well it would be popular.

The 811 is certainly an attractive tube economically. It has a mu of 160 as I remember. The Altec 1570B used them as did the Gotham Audio cutter head amp using a GR toroid for output.

Several of the last of the RCA MI-series cinema amps did this with
6L6s and I believe 6146s. None are desireable to the audiophile in
stock form.

They showed why toroids are a bad idea for opt's very well, although
there are still a lot of people not listening. With a conventional or
C-core transformer and a revised feedback loop the basic design is
well worth study, though.

The 811 can be substituted in the MI200 McIntosh if the proper
intermediate transformer is put in so as to get the filament voltage
at the 6.3 rather than the 10 volts of the, I think, 8005s. Although
the amplification factor of the 811 is way too high it works anyway.
Distortion still meets Mc specs. We wound one, in fact, where I worked
on a toroid, because we had plenty of scrap surplus transformers we
could dewind (and take the copper home.) And a Gorman winder, which
makes winding toroids pretty fast and simple. The 811s pull more
current but the Mc filament transformers never even got hot.

Because using conventional circuits the distortion was terrible. True
Class B operation works well only at high continuous levels without
extreme measures such as Wiggins and Mcintosh/Gow/Corderman afforded.
Al Bereskin at Baldwin designed the "poor man's Mc" for organ use and
it was published in an extremely good DIY article in the IRE journal
in '55 or '56. It never got below 2% THD.

The dual grid tubes strike me as a gimmick. Any pentode or beam power tube can be connected at least 4 ways. Connect the screen to B+ and it behaves as a pentode or beam power tube. Connect the screen to the control grid and it becomes a high-mu triode. Connect the screen to the plate and it becomes a low-mu triode. Connect the control grid to a low positive voltage and drive the screen and it is a space charge triode.

The 811 has only one grid as do other zero bias tubes like the 6N7 and 1635. They just wound the grid with many turns spaced close together to get this characteristic. Low-mu tubes like the 812, 2A3, and 12B4 have few turns spaced far apart. The only triode I know of with two grids is the 6C5. The second grid is internally connected to the plate.

I have seen circuits using 6V6s with the screen tied to the control grid to make a zero bias triode.

The old ARRL handbooks (50s?, 60s?) had a listing in their tube tables for using a 12AX7 as a class B zero bias output tube. They said it could produce 7.5W. I never saw a circuit that actually used one this way, however.

I'm astonished by the naivity of this!

Why would you think that a part or bag of parts marked "bad" should really be good, and that you should be getting good parts for the price of bad ones? This didn't raise any red flags for you? If you went to the supermarket and found a piece of meat that was marked 2 weeks out of date, would you take a chance on it because the merchant said he ate some last night and he didn't get sick? Even if the seller said that most parts that he tested were good, the fact remains that the parts were marked "bad". If you bought parts marked "bad" and they really were bad, then the only questionable part of the transaction is whether you paid too much.

There's an old saying that seems to apply here: "Who's more of a fool, the fool or the fool who follows the fool?". This isn't a matter of deceitful Asians or East Indians, or Russians, it's a matter fools rushing in where others fear to tread.

I knew a guy who used to go around to hamfests, fleamarkets and such things buying drives that were bad. He had memorized a list of manufacuturers and their date codes that were being repaired under warranty, athough there was no recepit, etc. They warrantied the drives for X years and if you called/emailed them with the serial number for a drive they would replace it free if those X years had yet to expire from the date of manufacuture.

I of course had no such luck, the one drive I bought from a ham at a hamfest with a warranty was dead. He gave me a card with his phone number on it, the phone was never answered. :-(

Other people also buy the drives beacuse without any testing there is a 50-50 chance it's circutry card on the drive or the mechanics. If you can inspect them carefully, or know the reputation of certain models, you can imporve the odds. If you buy enough drives cheaply, you can mix and match parts and get working drives out of them.

Memory is also a good bet, if you have the correct tools and skills, and get them cheap enough. Memory is discarded if one chip (of 8) or more is bad, so if you buy two units (SIMMs or DIMMs) there is a good chance you will get 8 working chips out of them. You need a diagnostic tool that will pinpoint the bad chip, and the skills to remove them and re-install good ones.

Obviously the skills are not commonplace and the tools are expensive, but if you do enough, you can learn to do it easily and pay for a set of tools.

Since just about everyone I know has a box full of "dead" RAM (except people who don't fix their own or others computers, or just throw it out), you could get all you need for next to nothing pretty quick.

So there is a good market for bad computer parts, but not a good chance of buying one and having it be good.

Geoff.

>
There is more than one way to skin a cat. The 811A is a high mu triode.
There are several ways to create such a beast.

One: place the grid closer to the cathode than to the plate. The ratio
of the distance between grid and cathode vs the distance between cathode
and plate is one of the factors that determine the mu of a triode.

Two: construct the grid with close spaced turns. The closer the turns
of the grid wires are to each other, the higher the mu.

Three: Use two concentric grids. This is very similar to number two.
> I also note that Terman claims that the dual-grid structure forms a

> a bitch to neutralize in common-cathode).
>
ANY triode works well in grounded grid. A high mu triode will have
better screening due to the close wound grid. Tetrodes such as the
4-400 have been used in grounded grid by grounding both grids. Others
such as the 4cx250 don't have enough heavy enough grids to handle the
current in class AB2 or B so they are run in cathode driven service with
normal grid and screen voltages, but with both grid and screen grounded
for RF.

Hear hear, Walt! (pun intended too)

I occasionally read notes from some Hams writing about the "empty bands". I suspect that they mustn't have much in the way of an antenna. ;^)

Perhaps that is okay though, as there appears to be some kind of correlation between those Hams who can't put up a good antenna, and a poisonous attitude.

> disposable income and plenty of time on their hands.

The demographics have changed. The idea of the Ham who has been licensed since they were 7 years old and has been in the hobby for 50 years is gone - and there weren't that many of them to begin with.

What we have now is the Ham who waited till their children were out of the house, or the Ham who decided to get their license after retirement. I got my license at 45. Big deal. What is needed is enthusiastic NEW Hams. And you can be any age for that.

And yeah, I love Homebrewing. Our club is holding classes in basic homebrewing to see how many of the newbies we can infect with SSA (solder smoke addiction) ;^)

That's one good reason, but don't forget those Hams who are tired and
bitter and just want to complain.

Especially the ones who can't put up a decent antenna, and think the
lack of signals means that no one is on the air! ;^)

What do you do for resistors if you can't get carbon composition in the ratings you need? I built a MFJ-1020A out of surplus and scrap before realizing that the metal film resistors I was using had inductive reactance when used in an RF circuit. My local parts depot mostly just has metal film resistors, not the carbon composition devices I need. Seems I heard somewhere that there is such a thing as non-inductive metal film, but if there is, how do I find it? Otherwise, where can I get carbon composition resistors these days?

Any help would be appreciated. My home-built active antenna (for shortwave) puts out such a terrible signal it is virtually useless.

Thanks,

Dave (an RF newbie)

I can't imagine that the resistors have enough inductance to
make any difference at HF. Plus, the reactive component
is in series with the resistance, which would increase the
impedance of the resistance slightly--in most cases that
would be more of a benefit than a hinderance; since I'd
bet most of the resistors are being used for biasing active
components, or to provide signal isolation..

Does anyone have any evidence that it makes a hill of
beans difference at HF?

Pete

Lots of stuff that works should be ample evidence.

There are some numbers in Experimental Methods for
RF Design that suggest such resisters are fine to low UHF.
It's really a non-issue.

Do what the professionals do - use film resistors. Concerns about inductive effect at HF are greatly exaggerated. There are rarely as many "turns" as often suggested. (cf. Radcom Jan 2007, p58, fig 1!)

>where can I get carbon composition resistors these days?

They are still available. Typically, Farnell offer 220R to 4K7 at 1W - but they are quite expensive.

And obsolete, because for every application there is now a better
alternative - most often, metal film.

Hmmm. Okay, well, could the problem be the monolithic ceramic caps I used?
Something is creating a boatload of harmonics, and that's the only other
component besides the transistors themselves.

Thanks much for the input...

Hi Dave,
This post mentions something that I did not perceive from your first post.
You mention a 'boatload of harmonics". As I understand it, the MFJ-1020A is
an active antenna circuit, but I don't have any details.
How are you noticing these "harmonics"? If you are hearing them from the
receiver this circuit is feeding, my guess is that either the active antenna
or the receiver front end is being overloaded and driven into non-linearity.
I would suspect the active antenna.
Can you provide more information? Where are you located, urban or rural?
What kind of system is this circuit a part of?

Bob

Hey Bob,

I am feeding a signal from my RF signal generator to the circuit on my workbench. I mention harmonics because the sinewave goes from nice and clean to "blurry" and looking "smeared" across the screen of my O-scope. I may *be* overloading it, but I thought that would result in clipping of the waveform. I have the signal generator set to attenuate the signal severely, and *thought* that would prevent overloading. Maybe not...

Back to work on it some more, and try to make sure I am not overloading the device.

Thanks,

Dave

Hi again Dave,
It is also possible that the circuit is oscillating. I have seen amps are ok with no input signal but will break into oscillation when a certain freq/amplitude input signal is applied (and vice versa). How did you build this thing? Circuit board, protoboard, dead bug.....???

Bob

Hey Bob, thanks for your interest.

I built it on a piece of perfboard with point to point wiring, clustering the active components and their biasing resistors fairly closely. I don't *think* it is oscillating, although to wouldn't swear to anything just now.

I have the signal attenuated as much as possible, to the point where it doesn't even cause a wiggle on the scope with my X10 probes and the scope set to 50mV/div. With the tuner set to resonate, it shows up as about 30 or 35 mV (5 MHz) going into the circuit. The output is 70 or 80 mV, but it is "blurred" and "smeared" as I described. Also, I just realized that the scope shows *2* traces, each identicle to the other (only using one channel, and one scope probe.) I can upload pictures of all this if desired, probably to alt.binaries.schematics.electronic. Don't know how else to describe what I am seeing. How could one signal become two traces, each identicle to the other?

Thanks much,

Dave

Wrong resistor value = bad biasing = harmonics? Just a S.W.A.G?

Hello Ian,

I don't get a chance to read Radio Communications often and didn't see your article. As a professional in the design end, I'll offer a few comments:

There is still (needless) confusion in amateurism as to metal film resistors' "inductance" in comparison to wire-wound resistors which DO have considerable self-inductance.

While there IS some self-inductance in metal film resistors (due to laser-trimming and patterns of film on the usually ceramic substrate), it is difficult as @#$%!!! to measure and easier (but still grudge work) to model as a conductive strip spiral-wound on the same physical dimensions. For nearly all amateur applications up to and including 6m, that won't be noticeable. With some caveats, of course.

Self-inductance of metal-film resistors will vary depending on the manufacturer and their methods. So will construction which adds varying self-capacitance from the end-caps (metal) holding the wire leads. Self-capacitance is easier to measure on a Q-Meter but is seldom over a half a pFd. That results in an equivalent of a resistor in series with self-inductance, the whole in parallel with self-capacitance. The effect on a circuit depends on WHERE it is placed in the circuit. I've found that carbon-composition resistors - in general - have a slightly higher self-capacitance...but that depends on who made them and what internal structures were involved (has to be broken and observed if no X-Ray machine is handy).

As a dummy load consisting of many smaller resistors in series-parallel, one can estimate the total capacitance and inductance based on individual resistor models arranged in whatever combination is planned. Offhand, I'd say that rarely does that affect the dummy load's VSWR beyond 1.3 at 6m. In arranging a series-parallel combination, there will probably be more effect from whatever conductors' shape are in doing the interconnects...less so if on a PCB, probably more if by wires. A good rule-of-thumb is simply "make all connections as short as possible, consistent with allowing air flow to dissipate heat."

The only place to get paranoid about effects of self-inductance and self-capacitance is in metrology. Metrology NEEDS to have a minimum of each and to have accurate resistance values at the rated frequencies. Everyday dummy loads for amateur radio are far from lab-quality metrological stuff and don't need to be in that precision range.

A picture would help. This sounds to me like it _could_ be just the scope. Seeing two traces (obviously not really identical or they would look like a single trace...maybe you're seeing two copies of the same thing, one shifted in time from the other?) tells me that the scope may be triggering or syncing twice per cycle. What kind of scope? Do you have full control over the triggering? If so, try varying the trigger level.

If you see a sine wave that's clipped (flat-topped) on the top and/or bottom, that's an overload of the active devices in the circuit, assuming you fed your circuit a good sinewave to begin with. If you see a trace that is widened out, it may well be oscillations on top of your desired signal.

There are lots of things you can do to determine what the problem really is. I'd guess it's unlikely that it's the resistors. I've used 2W metal-oxide spiral film resistors out to 450MHz for a dummy load, and the load had a very low reflection coefficient out to 2 meters, and quite usable at 450MHz, per an HP network analyzer.

In fact, carbon composition may NOT actually be better! They may show less inductance, but greater variation in resistance, than film-type.

In addition, if the resistors are used to bias transistors, and not as RF loads, a little self-inductance is not necessarily a bad thing. At first I thought your circuit was an RF bridge or some such, but apparently that's not the case. I do think you've barked up the wrong tree, and just need to find the right one. Leave no tree unbarked??

Cheers,
Tom

Hey Tom,

I'll try to upload a jpeg of the scope trace, and possibly the schematic and setup producing it. Would love to solve this mystery. There was a time when I had this active antenna working wonderfully. Now it's not much use, and I can't figure out why.

Regards,
Dave

Just posted jpegs of the scopetrace/schematic/device under test to
alt.binaries.schematics.electronic. Please let me know if I can provide
anything else for this discussion. Thanks to all...

Dave

I'm off to fiddle with the triggering level, which I meant to do earlier.

Hello Len

I beg your pardon, that was a different article by someone else. The one that I wrote, on the same subject, was in Radcom for July 2005.

Even so, both articles were saying the same thing - and you have written almost exactly the same again below! Nothing uncanny about that, of course: we are all looking at the same resistors, and noticing the same things.

> There is still (needless) confusion in amateurism as to metal
> film resistors' "inductance" in comparison to wire-wound
> resistors which DO have considerable self-inductance.
>
It seems to be part of amateur radio's eternal quest to reduce the whole of RF engineering to a series of simple one-liners, like "carbon composition = non-inductive = good" and "spiral = inductive = bad".

The vital part that gets squeezed out is always "by how much"?

> While there IS some self-inductance in metal film resistors
> (due to laser-trimming and patterns of film on the usually
> ceramic substrate), it is difficult as @#$%!!! to measure and
> easier (but still grudge work) to model as a conductive strip
> spiral-wound on the same physical dimensions.

I was able to make some measurements of (R+jX) using the N2PK VNA, with a test jig made from PC board and copper foil, and some care in the choice of open, short and 50R calibration standards. Sweeping from 60kHz to 60MHz gave almost constant R, and a "good straight line" of X against frequency. This implied that a simple series L-R model would be valid, and that self-capacitance effects were not significant over the measured frequency range.

> For nearly all
> amateur applications up to and including 6m, that won't be
> noticeable. With some caveats, of course.
>

Exactly so.

> Self-inductance of metal-film resistors will vary depending on
> the manufacturer and their methods.

Yes, very much so.

All of these tubular metal film resistors are based on a cylindrical rod of ceramic, with metal end caps connecting to the wire leads. A continuous layer of resistive film is deposited on the surface of the ceramic to form a continuous cylinder. A range of resistance values can then be achieved by cutting away some of the metal film - normally they remove a narrow spiral of material, leaving behind a broad spiral ribbon of film.

The resistance value will depend on the width and the total number of turns in this ribbon. The self-inductance will depend mostly on the number of turns (along with the other body dimensions, of course). When the number of turns gets much above about 10, the ribbon becomes quite narrow, which makes it difficult to keep control over the resistance tolerance. At that point, the manufacturer will switch to a base material of higher resistivity, so the next-higher value of resistor will drop back to having the minimum number of spiral turns; and so the cycle repeats.

This has two important results:

1. Some values of resistor will have significantly more or less inductance than others. All the way up the resistance range, from typically1 ohm to 10Mohm, there will be a series of break-points where the inductance flips between roughly the maximum and minimum possible values.

2. These break-points will vary from one manufacturer to another - for a given standard value of resistance, the inductance could be wildly different (ask Elecraft about that one!)

For 3W resistors using 3-4 spiral turns, I measured about 4nH. This correlated fairly well with the value calculated using the usual inductance formula.

Even in the worst case of about 10 spiral turns, the inductance would only be about 150nH, which is low enough for most RF applications up to 30MHz. For example, in a 50 ohm resistor, 150nH of series inductance would increase the VSWR to about 1.75 at 30MHz.

But that is very much a worst case. If VSWR matters at all, you would use a larger number of higher-value resistors connected in parallel, as Len describes below. This would divide the effect of the inductance by the number of resistors used.

1142. Pointers to (or on) block downconverter construction?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-09 13:54:24 UTC
From: Mike Andrews <mikea@mikea.ath.cx>
Message-ID: <evdgigtoq1@puck.litech.org>
Source record: 7831

I've got, and love, an RFSpace Inc. SDR-IQ software-defined receiver. It covers 100 Hz to 30 MHz, and lets me eyeball any 190 KHz (or narrower) chunk all at once, which is rather particularly nice. I'd like to be able to use it on 30 to 60 MHz and higher, which means that I need a downconverter. It seems to me that a suitable downconverter would let me set a switch to choose which 30 MHz band got mixed down to the roughly 0-30 MHz baseband.

I'd like to have this work up through the 70 cm. ham band for sure, and as much higher as I can get. I know that construction techniques change as one gets above HF, and change _radically_ at UHF and above. How hard is this going to be, overall?

The general setup I envision is something rather like

LO
n*30MHz
(n to |
(n+1)) |
* 30 MHz 30 MHz wide V 0 to 30 MHz
input --> bandpass filter --> mixer --> output
to SDR-IQ

Some questions for the (perhaps not older: I'm 60) wiser heads with more design-and-construction experience: is this at all a reasonable thing to do? Does anyone have any ideas on suitable mixers? Am I looking at a disparate-enough set of frequency bands that I will wind up having to use multiple mixers, possibly one per 30 MHz band, or per octave? It is trivially obvious to me that I'll need different antennas.

Is it reasonable to look at using a comb generator which is driven by a 30 MHz reference, so that I just take the appropriate harmonic and amplify it to a power level that suits the mixer I have to use for that particular 30 MHz band?

All of the discussion about metal film resistors and a pF here or there of stray capacitance is interesting, but the symptom sounds to me a lot like a cold solder joint.

Ahh! I was wondering how to break the news to you, Ian!

BTW, I was making a critical reference to that figure in G3LDO's article. It is figures like that that reinforce perceptions of significant inductance in such resistors.

Offhand, NOT hard at all...with the aid of some MiniCircuits
components such as the mixer and perhaps an input low-pass
filters. The down-converter's LO is going to be the bear
if you want frequency accuracy.

>The general setup I envision is something rather like
>
> LO
> n*30MHz
>(n to |
>(n+1)) |
>* 30 MHz 30 MHz wide V 0 to 30 MHz
>input --> bandpass filter --> mixer --> output
> to SDR-IQ

That's the general block diagram of every down-converter. :-)
With perhaps the exception of the "30 MHz wide BPF." Nearly all
wideband spectrum analyzers use a lowpass filter there with the
LO riding ABOVE the input frequency; image will be on the "high
side" and that is blocked-out by the LPF.

>Some questions for the (perhaps not older: I'm 60) wiser heads with
>more design-and-construction experience: is this at all a reasonable
>thing to do?

Absoutely reasonable.

>Does anyone have any ideas on suitable mixers?

I would suggest going to www.minicircuits.com and seeing what they
have...a rather large selection. Those are ready-built in various
basings and all cover an octave or more in both input and LO ports.

MiniCircuits has some nice tutorials on various aspects of Mixers.
Price is reasonable for ready-built components.

>Am I
>looking at a disparate-enough set of frequency bands that I will wind
>up having to use multiple mixers, possibly one per 30 MHz band, or
>per octave?

I would say a single Mixer rated at LF to 1 GHz Input will do the
job. Passive (diode) Mixers are as broadband as their coupling
transformers and diodes allow, something now quite wide in frequency.

>It is trivially obvious to me that I'll need different
>antennas.

Not necessarily. A discone can do nearly a double decade in
frequency range but at a slight loss (1 db or so) less than a
dipole. For more gain and directionality, a log-periodic for
VHF-UHF can be used for an easy decade bandwidth.

>Is it reasonable to look at using a comb generator which is driven by
>a 30 MHz reference, so that I just take the appropriate harmonic and
>amplify it to a power level that suits the mixer I have to use for
>that particular 30 MHz band? Would it be better, perhaps, to use DDS
>to generate the LO frequencies I want?

I would suggest a form of PLL, similar to a TV set-top box converter
for down-converting old UHF channels to VHF. The LO needs to
increment
only in 30 (perhaps 15 for 'havsies') MHz increments. The direct LO
frequency sample can be fed to a prescaler whose output (at a lower
incremental frequency) can be applied to a digital counter whose
output
is phase-frequency compared to a stable reference frequency. The LO
output to the Mixer needs only to be above the minimum specified level
and below a maximum, also specified if a ready-built mixer is used.
At below-1-GHz frequencies you can get away with attenuating the LO
level with a carbon-comp T or H pad figured for the common 50 Ohm
system. MiniCircuits also has VCOs of many kinds in stock and most of
those cover a half to a full octave in electronic tuning range.

Layout of the UHF needs, realistically, only an approximation of the
PCB trace width for "50 Ohm lines" on whatever substrate is used.
For very short trace lengths the "mismatch" isn't noticeable and,
for under-1.2 GHz frequencies, I've used #20 AWG wire without
problem in performance! :-)

In thinking more about it, salvaging an old TV UHF channel converter
might be a better idea, modifying its output to go DC to 30 MHz
instead of stopping at Channel 2; a few for cable TV service go
lower in output frequencies for built-in cable service functions,
depends on the maker of the set-top and the cable service. All
of those seem to operate at 2 MHz increments but use "in-house"

PLL subassemblies, circuit diagrams printed on unobtainium. :-(

Prescalers - as stock items - are now scarce but exist mainly as "house number" special orders. A few dealers have them as old stock left-overs. Nearly all operate up to 900 MHz so their ability to prescale a UHF LO is no problem.

The SDR-IQ is a fairly precision instrument as a spectrum analyzer and it deserves to have a down-converter checked out with good test equipment. Any one of the (now ancient) HP-608 signal generator models can cover up to the 70cm band with known RF output levels. That's another thing to keep in mind.

I hope some of this long text is a help to you.

73, Len AF6AY

[age 74 and been in the electronics design biz some...:-)]

I know it it's not a perfect solution, but this could be a good starter: find a selective Jerrold of OAK CATV converter. There must be thousands of them around for free. Try to improve the stability of the local oscillator; replace the jerky PLL oscillator with one or a few decent synthesizers, work on the input sensitivity, etc..

Have fun!

I think I will start by converting the impedances to turns ratios,
Perhaps this will make figuring out how to connect the transformers
easier. Are each of the secondary windings designed to handle the full
power rating of the transformer or will I have to derate it if I use
only the two ohm winding?

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

1151. IR adapter hack

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-10 02:30:06 UTC
From: Jim <jbasi@cfw.com>
Message-ID: <59234$461a8606$d80c3c03$8222@NAXS.COM>
Source record: 7836

I would like some help in hacking an IR printer adapter made for the HP 350c printer. This is a tiny pc board with a minimum of components connected via 8 wires to a parallel printer connector. I would like to put this to use as a serial port to IRDA device if possible. Yes, I know there are probably simpler ways, but this is a very tiny board, and I'd like to learn from it anyway.

This board is different from others I have torn into. It has an IRDA transmitter/receiver encoder/decoder similar to but a bit smaller than the HSDL7001 but only has the numbers R800 and 016A on the back. This is a through hole, 9 staggered pin device. This adapter was sold by HP so is this R800 an HP part? Wish I had a data sheet!

In addition there is a small crystal with the frequency 3.68 mhz but no processor......but does have 3 transistors, 2 resistors, and 2 capacitors (all surface mount). I think this is the frequency specified for 16xclk.

On the connector side, the only used pins are:

18 +5v
19 gnd
10 low-ack
1 low data strobe
13 high
12 high-paper end
19 gnd

19-31-36 (low) (gnd) are all conncted
11-16 connected (gnd)

The presence of the crystal leads me to believe that the baud rate is taken care of already, on-board. So how do I go about finding where the rx and tx connections should be. Or is this even possible? The circuit is obviosly getting it's power (5v) from the printer.

I have in mind to use this on my Etrex GPS to upload/download info via IR from my computer.

Thanks
Jim

Google for IRDA circuits/projects,etc.. there's alot of info out there.
I made one a few years ago,not hard at all.(all of about 3-4 components)

1153. Best ARRL handbook editions?

Newsgroup: rec.radio.amateur.homebrew

Hello all,
I have discovered how much fun tubes can be, and am in the process of planning one or more transmitters to go along with my 2-tube regenerative receiver. Now, I'm only 23 years old, so I'm in the process of researching hollow state technology. Could you please put together a short list of the "best" ARRL handbook editions? I have 99 and 05- I'm just looking for a few years to watch for on amazon, etc. Of course, recommendations for other books would be appreciated, too, but I'm on a tight budget...

Thank you very much in advance for your advice.

Ross, NS7F

IMHO what you should do is go to a library and find where the major
"houscleaning" was done and then get the previous edition. For example,
I have a 1995 (blue) edition, and it was much better IMHO than the
1996 (red) which I also have.

In any case, collecting a set of them may not be of much use to you.

Tubes have not changed much in a long time, so getting an early edittion
with lots of tube data and then copies of articles you want may be
a much better use of money and space.

73.

Geoff.

I have the 1964 and 1966 versions and there is VERY LITTLE difference between them.

They have designs for 4 simple transmitters with power that range from 10 watts to 100 watts. Also, they have a fairly good 'teaching' on transmitter and power amplifier design techniques [for tubes of course!].

I agree with the post that responded that they are quite similar within a basic technology. So, if vacuum tube simple transmitters are your passion, [desire, wants, likes, etc.] any of the ARRL handbooks from the late 50s to mid 60s should meet your needs.

Forgo the handbooks and look for QST magazines from the
40s thru the early 60s. Many larger libraries have the bound
editions... At worst, look for some used QST on CD editions
from that era.

Ross,

If you're interested in hollow-state technology, there are
lots of *free* resources on the 'net:

First up is Pete Millett's excellent book site:

http://www.pmillett.com/tecnical_books_online.htm

There are many excellent reference books online there,
free for the download, including ARRL Handbooks from
1936 and 1941 (IIRC). The files are often large but if
you have DSL or better they only take a few minutes.
With dialup they become a late-night hit-the-download-button-and-go-to-
bed thing.

He also has tube data online:

http://www.pmillett.com/hb-3_tube_manual.htm

The Glowbugs website has lots of downloadable info:

http://www.mines.uidaho.edu/~glowbugs/index.html

including some good manuals and articles on WW2 military surplus:

http://www.mines.uidaho.edu/~glowbugs/Military__and__Surplus.html

http://www.mines.uidaho.edu/~glowbugs/PDF%20files/

On the Glowbugs website are instructions on how to
sign up for the Glowbugs email reflector. Lots of good
folks trading info on their projects.

"Bunker of Doom" site with lots of stuff:

http://www.bunkerofdoom.com/

Transformer catalogs and other data:

http://www.bunkerofdoom.com/xfm/index.html

Another good site:

http://www.antiqueradioarchives.com/archives_index.htm

If you want the actual books, I would recommend
ARRL Handbooks from about 1954 to 1965, and RSGB
Handbooks. IMHO the RSGB Handbooks go into more
depth on technical subjects, and have better construction
articles, but the use of European tubes and other
unobtanium parts makes them difficult to duplicate.

Also be on the lookout for the ARRL publication "Understanding Amateur
Radio" (1st edition) ,
which has some good lowcost projects and well
written explanations.

Sign up for the Glowbugs reflector now!

If you are interested in tube gear then the ARRL handbooks from the early 1950s would be good. By the 1970s, the trend was toward solid-state gear. Of course, the 1940s handbooks are good too, but I like the ones from the 1950s best.

Right. So far, I am looking at the 40th ed (1963), as it has several
good tube projects.

My 'old' ARRL Handbooks are the 1936, 1947 and 1963 editions. I am
still looking for an inexpensive mid-fifties edition. Having one
edition from each decade seems to make the most sense as they do not
radically change from year to year.

Dear all,

I am new to DDS AD9854 and was wondering if you can help me with a specific problem not
directly solvable.

My main aim is to generate a simple chirp signal which should be Phase-Coherent. The standard output is Phase-Continuous. Does anyone have any suggestions how to do it ?

Many Thanks.

I am 63, and retired, and am also having a ball building my own tube gear.

Generally, solid state began to take over all the low level circuitry in the ARRL handbooks in the 1960s and particularly afterwards. There was a blend (between tube and solid state) at some interval but I don't look at the later handbooks at all any more. My handbooks are from early 1960s and go back.

The "Radio Handbook" by Bill Orr, also has editions going back, annually or almost annually, for a long time and has a different flavor but also good, and alternative presentations including very nice schematics and photos. The Radio Society of Great Britain (I think) also sponsored ham radio handbooks but I think may also be geared to European tube types which are different (at least to some degree) than US "valves" (as they call them), but you might try to do some research on that.

You might want to think about the tube evolutions: the very early tubes are harder to find and more expensive and particularly the tube sockets.

Around the 1940s we had mostly octal base (key plus 8 pins) and they are easy to find from tube supliers, but many were metal (not good if you like to see those filaments light up). If you like battery filament types (1.4 v for single C cell, 2.0 v for lead-acid cells, and 2.8 v, for two C cells in series) you have a small variety of nice 7 pin tubes (eg. 1T4, 1U4, etc), and a few 8 pin octal tubes (eg. 1A7, 1H4, etc). Prior tubes had poorer specs and the sockets are hard to find. The so-called Loctal

tubes (very thin pins and special 'click in' keys)..you just about can't find sockets for and they would be the hardest to build homemade sockets for, and, they themselves are not easy to find, either (I think they were mostly for car radios). Most of these tubes will run plate voltages on a handful of 9 volt batteries you can get at Dollar Tree for two for a buck, and you hook them in series with each other since the connectors are all male-female and otherwise don't need much to hold them together if you just lay them on the table and hook aligator clips to the terminal negative and terminal positive. A lot of the earlier tubes have difficult to find sockets (but Radio-Daze, in New York, has a lot of sockets).

Public libraries can be a resource but be aware that most smaller ones "discard" their older holdings and replace them with newer versions. Your best bet is to ask at the reference desk to find out how you can find which library has the older editions. The _central_ or _main_ branch (in your state) may be the only one that keeps older editions but you should be able to arrange an inter-library loan where you can borrow the book for, say, two weeks, and then if you like it, look for a copy on Amazon.com or www.addall.com or www.bookfinder.com or www.abe.com or www.alibris.com where you will find used copies at generally very reasonable prices. To find booksales where used books are very cheap, go to: www.booksalefinder.com

Good luck.

Thanks for the suggestions, but I see I need to be more specific about what I need.

I'm looking for a Windows-based program that runs on a local machine rather than remotely as at a web site. The objective is to find a program for EZNEC to write input files for, so that its frequency sweep impedance data can be easily and directly imported into the Smith chart program for visual analysis and to aid in designing narrow and broadband matching networks for antennas. EZNEC originally did this for MicroSmith, then WinSMITH input file writing was added when MicroSmith became unavailable. Now WinSMITH is also unavailable, so I'm looking for another one which I can adapt EZNEC to.

Hi Roy,

Darn, sorry that WinSMITH is no longer available. Hope you'll
continue to support that format for those of us with that program.
Based on what I just found, I don't have any reason to quit using it.

You might try LLSmith from
http://tools.rfdude.com/RFdude_Smith_Chart_Program/RFdude_smith_chart_program.html.
I don't like it as much as WinSMITH, but it looks like it does
somewhat similar things. I found it via a Google search, which led me
among other places to http://www.sss-mag.com/smith.html and
http://www.circuitsage.com/matching.html. The latter one provided the
link to LLSmith. I think I have a useable version of Motorola's Smith
chart program somewhere, but the version I just downloaded is pure
garbage from my point of view; it may work but it's so awkward that
it's worthless to me.

Cheers,
Tom

Thanks, I'll look those up. Negative recommendations are as useful as
positive ones, so thanks for those too.

Don't worry, EZNEC will continue to write your choice of either
MicroSmith or WinSMITH files as well as whatever program I choose for
their successor.

Additional comment: if you write impedance files in standard network analyzer format, they can be used by a lot of programs. I believe you can find fairly detailed descriptions of the .s1p format on the web. In particular, RFSim99 can read such files and use them in a 1-port representation. It will even do an automatic L match to an impedance, and will display S11 on a Smith chart. (But I'm remembering a problem if you write them in dB format, something about that RFSim99 uses 10^(dB/10) instead of 10^(dB/20) to convert them to linear before it uses them...)

Cheers,
Tom

OK, I gotta quit looking at Smith chart stuff...

Are you sure WinSMITH is no longer available? See http://www.scitechpub.com/WinSmith.htm.
Looks pretty current to me. My 2.0 version was provided on floppy,
and I see they've gotten into the 21st century and have it on CD-ROM.

Try SmartSmith for Windows by W9DMK.

Hi Roy,

There is a very slick one Switzerland:
http://www.fritz.dellsperger.net/downloads.htm
from Dr. Fritz Dellsperger.

It, like your software, has a free but limited use. Getting the full
use one is rather more obscure as there is nothing mentioned at his
site as how to get a key or otherwise obtain full use (more than a
limited number of points). Somewhere, there was the suggestion of
accommodating a user if they emailed, but that never worked for me.

I just want to say that if you want to build your own tube gear, you
should look seriously at compactrons. Designed for consumer electronics
use, they have some excellent specifications and a lot of elements in
a package. And they are absolutely dirt cheap because there is no demand
for them on the surplus market at all.

Some of these things are absolutely wonderful performers and available
free for the asking. 12 pins good!

Hi everyone,

I have a small question about PSPICE. I'm using PSPICE to simulate a colpitts oscillator, and want to know the resonant frequency of the circuit. What should I do to set up the simulation condition? I used the transient simulation and FFT hoping to find the spectrum figure, but it seems if I change the time step the spectrum also changes??? What should I do now? I'll appreciate any of your help!

Jessie

At resonance, the phase shift through the circuit is zero. Break the loop where it connects to the input of the active device and put a low level source at the input of the active device in place of the loop connection. Do a frequency sweep, plotting phase, and find the frequency where the phase angle at the top of the tank is equal to the phase angle at the capacitor tap. You should be able to do this with a single plot of the phase angle difference.

This is close to the frequency at which the circuit will oscillate. It'll oscillate where the total phase shift around the loop, which is the sum of the shift through the tank and the shift through the active device, is zero.

Roy Lewallen, W7EL

I haven't used PSPICE for several years and am unacquainted
with newer versions, preferring the LTSpice free package
available from Linear Technology Corporation. Both use the
same SPICE core routines-algorithms so it all depends on
how the variants "wrap" the core routines for human interfaces.

None of the SPICE variants can yield an "exact" frequency
of oscillation...but you can come close to that depending on
how many thousands of repetitive cycles it allows in memory
and the available memory of your computer. [I would carefully
check the PSPICE manual for conditions necessary with
their "wrapper" controls]

With LTSpice I've not had a problem with oscillator circuit
simulation start-up...not with starting at t=0 or delayed.
For example, a 10 MHz crystal oscillator simulation might
take 50 mSec or thereabouts to reach a stable oscillatory
condition so one can't expect to see a sinusoid oscillation
very near 0 time. With L-C tuned oscillators the start-up
time is sooner than that due to lower Q of L-C versus a
simulated quartz crystal.

One of the difficult tasks in designing an oscillator circuit
ON Spice (as opposed to beginning on paper) is obtaining
proper feedback and the limiting conditions of voltage-current
swings. There isn't any "easy" answer for that. An
integrated schematic-net-list function (as in LTSpice) makes
it easy to twiddle values to get one going. More twiddling
with values gives one a "feel" for getting the right mix of
parts values. My suggestion is to do that twiddling of values
until oscillation is established and seems stable enough with
supply voltage variations. Once there the measurement
procedure for actual oscillation frequency would be rote work

of counting of oscillation cycles and their slight phase shifts over the time intervals. The first step is insuring there IS an oscillation happening.

In the beginning of SPICE (core entirely free from Berkeley) it was a #$%^!!! job to introduce some kind of momentary transient (or "noise") to disturb the simulation model ("shock" it gently if you will) to begin oscillation. Most variants no longer need that since their "wrappers" have been modified to handle it.

The only question on various SPICE packages is their numerical accuracy in regards to frequency of oscillation. Few packages will say that directly. At minimum the simulation calculations would be done with "single precision" equivalent to 7 decimal digit calculation accuracy. Most seem to use "double precision" or 14 decimal digit equivalents so the simulated oscillation frequency could be close to 1 part per million for a very large circuit model (worst case with all errors adding up the same worst way).

MOST IMPORTANT of all is the simulation model and its components, including the stray/parasitic parts of each passive component as well as an accurate model of the active parts (transistor, diode, or vacuum tube). Most SPICE variants have a large active component library and those are quite accurate to nominal operation of the real parts. Failure to model the circuit correctly will result in failed results...one just can't cobble together some parts as on the bench and get some kind of action going.

OK, now that I've done the "spanking" [:-)] about basics, it's time to get the model working. Once that is done, the niceties of checking the harmonics is one of the last jobs. The FFT check on harmonics in PSPICE is probably different from LTSpice because the FFT routines are in the "wrapper" of the SPICE routine's core. Those vary depending on the variants program build.

Good luck on your model.

73, Len AF6AY

1182. Help with antenna extensions

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-13 20:34:25 UTC
From: fogus <gfogus@gmail.com>
Message-ID: <1176496465.011395.221450@n76g2000hsh.googlegroups.com>
Source record: 7771

Hello all,
I am just starting to get myself into Ham Radio. I am finding
studying Morse very hard, but I really want the general license, so
I'm sticking to it.

My questions to you guys today regard antennas. I would like to have
some antennas mounted on my house roof. I live in North Vancouver,
BC, Canada, if that helps any in giving suggestions. I am curious
about what antenna is used for which frequency. I would like to be
able to transmit on the HF and VHF bands. Apparently there is
something about a 10-meter band, a 15-meter band, etc. Why are they
called meter bands? Is that like an electric "meter" or something, or
is that like the "metre" unit of distance measurement? If it is the
metre of distance, do the numbers represent how high the antenna has
to be, or how long, or what? There is no way I can have a 60 metre
antenna on my roof! Perhaps they could be coiled up or something?
Can one antenna transmit on a broad range of frequencies? How much
should I expect to pay?

Second question, with hand held 2-way radios, in North Vancouver, the
range is limited because of the hilliness. I literally live on a
mountain, and there are forests and valleys everywhere. My house is
on a bit of a hill, and standing on my balcony I can receive and
transmit very well over a good range (2-3 miles). On ground level in
the same home I can get 1 mile at most. In the basement I can get 0.5
miles. What I want to do is to stick my antenna (from the BPR-40, Mag
One by Motorola) up high on my house, and then transfer the signal,
via wire, down to my room or even the basement. The threading seems
pretty standard on the radio, but is doing this possible? Would it
screw up the "meter" of the antenna? How could I transfer the signal
without messing up the "meter"? I would like to transfer the signal a
minimum of 50 feet.

Thanks,

fogus

Good idea Tom. Roy: Besides RFSim99, Agilent's free AppCAD program has a mode where it can overlay a set of data on a Smith chart, having read it from the Touchstone ("standard network analyzer format") files.

Well, I'm already committed to 7 & 9 pin miniatures, and 8 pin octals,
have plenty of sockets, and more than enough tubes for my lifetime.

Once, long ago, I had a filament battery portable AM radio. About half the
size of a cigar box. Four tubes, one D cell, one 90 v B battery, and lift
up the cover, and it goes on in about 1/2 second, and sounded good. If I
have time, I'd like to build that (if I can't find a replica, or a similar
set [I think the old Zenith trans-oceanic had battery filament tubes, too,
might be interested in one of those instead]). Just for nostalgia.

RE: METERS
The term "wavelength" is left over from the early days of radio. Back then,
frequencies were measured in terms of the distance between the peaks of two
consecutive cycles of a radio wave instead of the number of cycles per

second. Even though radio waves are invisible, there is a measurable distance between the cycles of electromagnetic fields making up a radio wave. The distance between the peaks of two consecutive cycles is measured in meters. The relationship between a radio signal's frequency and its wavelength in meters can be found by the following formula:

wavelength = 300 / frequency in MHz

Certain segments of the shortwave bands are referred to in terms of "meter bands" as a convenient form of shorthand. For example, the term "10-meter band" is used to refer to the ham radio band that extends from 28000 to 29700 kHz.

Muliband antennas are common. For example, the Cushcraft R8 overs 6,10,12,15,17,20,30,40 meters

The GAP Titan DX antenna covers 10m 12m 15m 17m 20m 30m 40m and 100 KHz on 80m Using a tuner and a long wire -- just about all the bands can be covered.

SGC makes a tuner that will cover 1.0 to 60 MHz with antenna lengths of
Minimum lengths: 8 feet(3.3 to 60 MHz)
23 feet(1.0 to 60 MHz)

For your VHF antenna use low loss coax (50 Ohm) rated low loss at the frequency you are operating at.

P.S. A long transmission line "does not mess up the meter" as you wrote.

I have run 100 feet of coax in an installation without a problem

Hope this helps

Good Luck

Lamont

Hey, thanks Lamont! That helps a lot. Wavelength being the meters, the number 300 coming from the speed of light in thousands of kilometers (right?).

Just one question though: When I look at my walki-talki's antenna, when I unscrew it, there is just a single threaded piece of metal, not two cables. Correct me if I'm wrong, but wouldn't attaching a cable to this threaded piece of metal change its receiving and transmitting characteristics? What is behind this antenna plastic in my hand held? A spring like structure? Doesn't the antenna need to push and pull the electrons? How can it do that if there is only an entrance? I'm kind of confused about this antenna design stuff. Is there a paper online where I can read about it?

Are you saying that if I bought a spare antenna for my radio, put it above my house, and ran a single wire (within the coax shieldings, of course, but essentially a single conductor) to my radio, that it would work, perhaps even better than inside my basement? That would be great.

Wouldent there be a major hurdle in setting up a repeater station, if there were only one between two radios? I thought a repeater had to receive on a different frequancy than it transmitted on.

Thanks for those model numbers, BTW, that helps emensly. Would those work attached to a hand held, or would I need an appropriately powered transmitter? I will look those up soon.

Sorry, that was actually a lot of questions.
thanks again
fogus

Without knowing what Handie Talkie you are using, but in general you need an
adapter from the HT that mates with 50 -ohm coax. Your local Ham dealer
should have the adapter. My guess it would be an SMA to SO-239 adapter.

See URL:
http://cgi.ebay.com/SMA-Male-to-UHF-Female-SO-239-Adapter-1-Shipping_W0QQitemZ220081794583
QQcmdZViewItem

No you need both the center conductor of the coax and the shield to connect
to the radio.
>
> Wouldent there be a major hurdle in setting up a repeater station, if
> there were only one between two radios? I thought a repeater had to
> receive on a different frequancy than it transmitted on.

A repeater does operate on two different frequencies, but the key to a
repeater is a duplexer operating into a single antenna -- see repeater block
diagram at URL:
http://www.hamuniverse.com/repeater.html

Not a simple matter however, a repeater needs a controller, timer, IDer and
quite a bit more. And they are expensive to buy or build.

>
> Thanks for those model numbers, BTW, that helps emensly. Would those
> work attached to a hand held, or would I need an appropriately powered
> transmitter? I will look those up soon.

Well most handhelds are VHF/UHF only. When you are talking about 160M thru
10M, a different radio is needed -- maybe like the Yaesu FT-817ND
URL:
http://www.universal-radio.com/catalog/hamhf/1817.html
>
> Sorry, that was actually a lot of questions.
> thanks again
> fogus

Do you have a Ham Store nearby - take in your HT and see what they
recommend.

I'd suggest an MK484-style MW receiver that feeds a simple common base VCO like your average "FM Bug" circuit. Needs only a slack handful of components, fits in a matchbox and would run from a pair of AA cells for days.

ungvichian wrote:

Both seem to work for me,although one is more of a "spec sheet" and the
other is in Chinese/Japanese -but the schematics are in engrish. :-)

Thanks! Perhaps I can convince a Japanese reader to translate the text ;)

I didn't find these in my searches; I had a number of dead links from
other websites and Google produced dead links to Chinese IC info sites.
Alldatasheets.com also didn't have them and I have avoided other
datasheet sites since most have gone to paid subscriptions.

The schematics appear to involve reference designs that I've seen
in some of the products which used this device; the text surely includes
important design and parametric information and deserves translation.

If anyone has the English text version please let me know.

Regards,

Michael

What chip did you use? A Vishay TFDT4500 or something like this? The data sheet would suggest what you indicated about 4 or 5 components needed. Other than that, Maxim and Microchip parts would require more work and parts.....what other options?

Thanks
Jim

IIRC the one I made connected to the serial port,and was nothing more
than an IR reciever,and an infrared LED..couple resistors,and a Diode
and small cap,or something like that...no chips needed.
Connection to the parallel port might require some more 'trickery'.

Saturday I found an electronics kit at a yard sale I was an unassembled all in the box AA5 receiver. Looks lie it is some kind of educationa kit. It was all in the box but it did not include the cabinet just the chassis and parts. I was thinking of assembly it on a larger chassis and then begin making mods on it. I am thinking more IF stages, mechanical or xtal filter, xternal VFO(my sig gen) BFO any other ideas on what you could do with one of these.Of course adding a transformer.

I wonder if we who are the Usenet-frequenting Radio Hams might somehow get together to sort out the dreadful mess that has been created in no small part by the self-interest of those who control the RSCB?

Might we all act together to produce a series of "biscuits" that could then be assembled Lego-like fashion to produce any rig or test equipment? This would have a number of benefits, not the least of which would be the bankrupting of the cancerous emporia whose off-the-shelf Cheque-Book (CB) radios are not only discouraging the homebrew engineering that is the essence of _REAL_ Ham Radio but also encouraging an altogether undesirable element to regard themselves as of our ranks. Once the advertising income from those dead emporia ceased to flow, then the national societies might get back to supporting technical excellence instead of Complete Bullshit (CB) as they do now?

(And, no, I'm not thinking in terms of the facile hardware exercises that bring on the disease known as the gangrenous degeneration that is the M3/CB Fools' Licence scheme; facile because once a so-called "licence" has been granted the hardware diversion is largely forgotten.)

Like LEGO? Well done for realising that currently amateur radio has
done little to interest the under-fives. Maybe it's a whole new market?

G4SDW & "Straydog"

There are many groups on the Internet that are devoted to homebrewing their own ham radio equipment. They run the full gamut of interests from old valve type equipment to the latest in microprocessors and microwave component based projects. You are welcome to join and participate in these groups.

A truely excellent idea Gareth.

Why don't you rough out a plan and design a few of these "biscuits" and
publish them on a website or maybe in one of the various journals that
support the hobby.

Good luck and I look forward to seeing your first designs.

Hi all,

Just got an email from SciTech Publishing about a sale linked to their 10th anniversary. Some reading this group might be interested. From their home page at http://www.scitechpub.com/, click on the link just below the banner, "RadarCon 2007 - Take advantage of our special conference prices. "

Though it's mainly books, you can also pick up WinSMITH 2.0 for $89 insead of their usual $125, I think it is, which is a discount from the "list" price of $149. There are quite a few books with "antenna" or "antennas" in the title, though most are a bit esoteric for ham use, and there are some "receiver" books. The discount is 40% from their usual prices for SciTec and Nobel titles, and 15% for others. The 15% may not be very exciting, but the 40% seems worthwhile if it's something you're looking for.

Cheers,
Tom

March's RadCom had a QRP transceiver with just 11 biscuits. None of
the biscuits had E numbers, and only one had silicon.

Maybe he does know it but that doesn't mean the idea is not a good one.
Truely new ideas are few and far between. I've come across it before as a
suggested way to cope with component obsolesce issues in long service life
applications- a chap I used to work with coined the idea of "tokens" (as I
recall). Basically the idea was a library of circuit building blocks that
could be assembled to make a larger circuit. If a particular part could no
longer be obtained, a new "token" could be designed with a defined interface
and functionality.

A sound idea but not an easy project. However, if Gareth can get something
rolling, maybe expanding on Eamon's and/or George's ideas, so much the
better. I'd not knock the idea, quite the converse.

So get rolling Gareth, let us see some of your ideas on the web or in Sprat,
etc.

The seminal book "Solid State Design for the Radio Amateur" (1977) by Haywood et al had pages of circuit snippets. I also think that PW do boards for different radio modules. I suppose one might envisage a sort of mother-board into which modules might be inserted to allow different designs to be built up? I am not convinced that the idea will go far though. It is quite easy to breadboard almost anything on double sided pcb quickly and easily.

True but one advantage of the "biscuit" idea is that you can build and test
them one at a time- ideal for beginners who may be put off by a complex "one
lump" project that they lack the experience to fault find etc.

Really, I think Gareth should run with this idea.

Hi Len,

Thank you very much for your detailed explanation on SPICE. I think a very fast way to find the resonant frequency is to know the critical resonant frequency first, and try to find the resonant period which is

corresponding to the highest voltage in the plot. After that, you can do a FFT if you're lazy to convert the time period to frequency. Although this is not very accurate, but this is the most direct way to simulate resonant frequency I guess. Hope my final solution is not too coarse...

1223. Mechanically aligning old variable caps?

Newsgroup: rec.radio.amateur.homebrew

I have a fair number of medium-sized (i.e. big enough for a 100-watt amp or antenna tuner) variable caps that have one problem:

The spacing of the rotor does not match the spacing of the stator. I can line up the front end to be nicely spaced, but then the back end is too close. Or I can do the back end, and the front end is too close.

I can compromise by choosing a point halfway between the two alignments, but:

Were these old capacitors (many of them from the 20's and 30's) really so poorly constructed that the rotor spacing did not match the stator spacing?

Or is there some long-term "swelling" of the metal parts that results in this misalignment?

I could correct the slightly-off spacing by pulling out the spacers on the rotor and grinding them down just a little bit each (literally, just a thousandth would be too much), but I think there must be something more fundamental that I'm missing :-).

Tim.

Pot metal. It suffers from grain boundary distortion caused
by moisture. The problem is very common in some tuning
caps used in TRF Majestic radios made in the early 1930s.

One problem you'll is that the capacitance will be much
higher than it should be if the plates aren't centered. The
capacitor change isn't linear--that means that equally
shifting the distance between a rotor plate and two
stators from center causes an increase in capacitance.
Intuitively, one would believe the changes would
cancel each other.

==========
The power rating of a rheostat is based upon its total resistance R.
allowing for a max current I with P(max) equals I*I*R

If the adjustable resistance is reduced to say 1/5 of the total
resistance that reduced resistance can accept the same current I .
This means the power rating has been reduced by a factor 5 ,in other
words the power rating is proportional to the set resistance.

What I had in mind was a slightly higher level
system view.

So starting at the easy end, we might specify that
the AF amp takes 100mW into 600 Ohms, and
delivers 1W out into 8 Ohms. a biscuit to do that
might take many forms but would all be interchangeable.

If an audio filter were to be included, that would
work in and out at 100mV into 600 Ohms with
0dB gain - and would thus be an optional fit
prior to the AF amp.

I'm not thinking in terms of mother and daughter boards,
but of a set of standard biscuit designs that could then
be assembled into whatever, test eqpt or rig.

Although we'd be using small miniature components (is
anything else readily available these days?) that miniaturisation
does not have to feature in our biscuits necessarily, so
we might have SMDs but spaced out by half-an-inch, or so,
to enable us to work with them.

Setting aside the infantile remarks and attention-seeking
from "the usual suspects", I'm proposing that this be a joint
effort.

Each biscuit would be a standard size or a multiple
thereof, I'd tentatively suggest 1 1/2" X 2".

Assembly of a transceiver would then consist of
biscuits mounted horizontally. The idea is that we
put HB firmly back on the map as the standard
route into HamRadio, so I'm not after miniaturisation.

Perhaps if we could produce rigs of the size of floor
plan size of the old FT101 we'd be OK for easily
doing our own maintenance....we need to ensure room to
get a soldering iron and a probe in there without fear
of affecting other parts.

For all their simplicity, this spaciousness and room-to-breathe
was something desirable that was lost with the demise
of valve ("tube" to the Yanks) rigs.

==========

Just for information :
A modular approach to homebrewing (call it biscuit building) is also very well propagated in the book : Experimental Methods in RF Design ,by W7ZOI , KK7B and W7PUA. Most modules are built in 'ugly contruction' style for best possible (RF) stability and low cost .

Well, if he comes up with some designs he is vindicated. If the biscuits
turn out to never to be at least half baked then you are vindicated.

He has suggested the idea, I've supported it and offered to host the designs
the ball is now in his court.

Well, I still recall the FT-707 that was bought in order to implement
a DSP CW transceiver for 136 kHz.

It fell at the first hurdle as it wouldn't work on CW.

Despite receiving helpful suggestions via this medium, Gareth never
saw them due to 'an ISP failure'; and nothing more has been heard of
the project - at least on here.

Gareth, you must have missed my post that offered to host your designs on a website, with fully credit to you for the idea and your work.

Please, do some of your designs and I will gladly host them until you have your own website. OR, set up your own website and I will ensure that it is circulated to those who may be interested.

Get those biscuits baking!

I've got a few 6AR11's and 6AF11's that I've been meaning to use for
something. The 6AR11 puts two if stages in on bottle. I also have
quite a few 85khz command set IF cans, so that would be nice. The 6AF11
makes a nice dual af stage, plus the extra triode can be used as an agc
amplifier, smeter amp, or bfo tube. I was thinking of making an all
compactron clone of the Drake 2B at one time, using a last if of 85khz
instead of 50khz to make use of the command set coils.
It would use one 6AR11 as the rf / first mixer, and at the IF stage.

A 6D10 could be the vfo, HFO and hfo buffer. The last mixer would have been a 6BE6 cause I couldn't think of a compactron for that stage.

Another idea is the one tube regen from 'pop tronics using the 6AF11.

Sorry, I disagree with many of the suggestions being made. Putting a nonlinear device or devices like a zener or a series of diodes across your antenna terminals can produce intermodulation among incoming signals. These will appear at your receiver as hash and spurious signals at various frequencies. When transmitting, they can create harmonics.

The advice I do go along with is to put a resistor or RF choke across the terminals if static is a problem. Either will prevent it. You won't be able to tell any difference between carbon, carbon film, and metal film in just about any RF application -- any are just fine. Don't use a wire wound resistor, however.

I don't see much sense in letting static build up to several tens of volts, then have a neon bulb ignite to discharge it -- with a loud pop you'll hear in your receiver -- down to a slightly lower level. A resistor or RF choke will keep it at near zero. By all means, have fun impressing your friends with blinking NE-2s, but use something else to drain off the static.

Back in the good old days of CB, in Chicago, I had a ground plane
antenna which had no DC return path. My Lafayette CB radio started
making some very strange noises so I disconnected the PL259 and was
surprised to see a spark jumping across the connecter. This continued
for hours as the voltage built up and discharged. Pretty impressive
display of precipitation static.

I doubt his sincerity, based on his previous emotional
history expressed in this NG, and his contemporaneous
linking up with Mrs.Nugatory in an abusive sub-thread.

What you have quoted below is most certainly _NOT_
a support for the proposal. There is no suggestion of what
the biscuits might be; no suggestion of what the standard interfaces
between biscuits might be; no suggestion of what the mechanical
arrangements migth be; no proposals of component sets.

In fact, there has been _NO_ support whatsoever for the
proposal that _WE_ all act together to save Ham Radio
from the predations of the RSCB and other destructive influences.

What has there been?

Why, merely an examination of means whereby the proposer
himself might gain some attention and reflected glory from
the actions of others and to set in place, perhaps, the
groundwork for a campaign of further abuse, as is his wont.

Web-sites? SPRAT? This is merely stating the bleeding
obvious and as a claim for having supported the proposal
it is _NUGATORY_ in the extreme.

Mrs. Nugatory's lashing out in an infantile temper
tantrum now that she has been bested!

Any doubts that she's an anonymous cowardly poison-pen?

None, I think.

Now, Mrs. Nugatory, instead of displaying negative and
destructive tirades against me, why not discuss some of your
own projects and project ideas over the years? It is of course
extremely easy, some might say cowardly, to pick on someone
who has discussed ideas and possibilities over the years in an
attempt to promote the _REAL_ in _REAL_ Ham Radio, and
this picking-on is what you do. However, I think it more appropriate in a NG
for us all to contribute positively to promote the technical pursuit.

Go on! Dry your tears" You _CAN_ be a grown-up if you really try!

I've never written a follow-up to a Lewallen post, but here is
another advantage to using resistors that Roy didn't mention:

If you put your resistor(s) at an OUTside grounding point and
if you can remember their value(s), you may be able to make a
quick test of the integrity of your feedline from INside the
shack with an ohm-meter! (But NOT during a storm, of course!-)

Not really, if you'd prefer to "do" your own website, please do. I'll just
promote you work via a link etc. I read SPRAT and will happily buy PW if
you get published there.

> perhaps, the
> groundwork for a campaign of further abuse, as is his wont.

How does that work then? All I'm suggesting is support for your idea- which
I really do think is a good one. I'm happy to promote it but you will need
some more " flesh on the bones". Now, if you idea doesn't take off because
you don't publish your ideas, whose fault it that?

> Web-sites? SPRAT? This is merely stating the bleeding
> obvious and as a claim for having supported the proposal
> it is _NUGATORY_ in the extreme.

Well, so far we've had the initial idea (which is a good one), an offer of
some "promotion", and little else from you. I'd hate to see this idea die
so common on, where is your material?

You're missing the point of my suggestion, and no doubt
being deliberately perverse, which was that we should
all act together in such a scheme to counteract the
damage that the RSCB is doing.

The first move for a joint approach is to canvass for
support.

Interesting that you of all people should be trying to
make it seem that you are supporting this campaign against
the RSCB, is it not?

And I've done a bit, maybe you can now do a bit. I admit no one else seems to be rushing to help but, unless they see some progress, they will think your intentions are less than genuine. The best way to tackle this is for your to provide some more "flesh on the bones".

>
> The first move for a joint approach is to canvass for
> support.

No one else seems to be rushing to help but, unless they see some progress, they will think your intention isn't genuine. Conversely, if you provide some more "flesh on the bones", then people are more likely to support the project.

> Interesting that you of all people should be trying to
> make it seem that you are supporting this campaign against
> the RSCB, is it not?

Who are the RSCB? I don't see this "campaign" as being against anyone. I do see your idea as a vehicle to promote home construction etc. so I am happy to support it.

So, where are those ideas? If you'd rather I didn't promote your work via my website just say so and "do your own thing". However, having sown the idea, you need to build on it ASAP- otherwise some might think your intentions are less than genuine.

A couple of points should be made here:

1. There is no such thing as the RSCB.

2. In your original post, you said "Might we all act together to produce a series of "biscuits" that could then be assembled Lego-like fashion to produce any rig or test equipment?". This appears to be an admirable suggestion to help newcomers to electronics and amateur radio, not a call to arms against a non-existent organisation called the RSCB.

3. You seem to come up with many questions in this newsgroup but sadly never seem to follow on with helpful solutions. It would be extremely helpful if you did, so please do as I would be very interested.

Thank you Mr. Evans.

How is that Gareth? Come on, a few published designs of your "biscuits" and your idea will be up and running. However, if you don't progress the idea it will wither and die. That would be a waste of a good idea.

I've offered to assist, if you decline that offer and succeed anyway all the better for you. However, if you don't make this work, then it will reflect on you and you only.

Get baking ;-)

I quite agree, Gareth's idea is an excellent one. I've heard something
similar before (not my idea, someone else's) and it didn't take off. Partly
as there were other constraints which don't apply here but partly as the
originator didn't follow through.

I'd also be interested. However, I seems you and I are more keen to progress
the idea than its creator.

Do you have an antenna analyzer?

Or, wouldn't it be easier just to use a dip meter to
see where the trap is tuned?

1265. Homebrew 11 tube CB receiver info wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-19 03:46:25 UTC
From: Jim <k0jkj@arrl.net>
Message-ID: <1176954385.065401.253350@n59g2000hsh.googlegroups.com>
Source record: 7653
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I recently won a HOMEBREW 23 channel CB receiver. Yes I know it's not a real boatanchor but given that it has 11 tubes plus several diodes , I thought I'd ask about it here. It looks very well made.

I was hoping that some one would recognize it by tube line up. I just looked at it and haven't started drawing the schematic yet. It has the following tubes, 6EH7 (the RF amp) , 12AT7, 12AU7, 6BN8, 6HR6, 6BA6, 6BE6, 6GX6, 12AX7, 6AQ5, and an OA2. It has 6 RF and IF transformers.

The antenna is connected directly to a transformer with the RF amp feed by a cap off the secondary. The first oscillator(?) Uses a 29305 Kc crystal. It has a "S meter" and what I suspect is a meter adj. pot on the back. There is a octal socket on the back labeled transmitter that has two lines jumped as well as a voltage divider with a large electrolytic to ground in the middle of the divider.

The tuning cap is three section with one section switched by a control on the front panel. The tuning cap is driven by a very nicely home made dial cord mechanism with a heavy flywheel. So far I have figured out the RF and audio gain controls. The other two front panels pots function are a question as well as the functions of four multi section toggle switches. With the filter caps being bad. I have not powered it up for more than two minutes.

Does anyone remember a home brew rig with these features HAM or CB? I would like to find a schematic if possible. I looked at the HBR site and it doesn't seem to match anything there. But given the limited 23 channel coverage plus channels A-D it looks like it's from the late 1960's or real early 1970's .

Thanks

Jim

Jim,

I'm very surprised to hear that someone would homebrew a CB rig: I'd guess it's a commercial unit without the front plate unless the workmanship is definitely "homebrew".

The mixer crystal is a puzzle: it implies an IF in the ~3.3MHz range, which I've never seen before. OTOH, if it was made for 10 Meter ham use, a 29.305 MHz crystal and a 455 KHz IF would work out to either 29.760 or 28.850 MHz, and only the lower frequency is in the 10 meter band. It might have been a custom-made unit for CAP or other use on 29.76, but I don't have any experience with those.

I'm going to guess that you have a CB set that was modified for either 10 meter ham use or for some quasi-government use on 29.76.

HTH.

William

IN the sixties (and early seventies), it was common for the hobby electronic magazines to treat CB as a hobby. This was especially so for "Electronics Illustrated" that had quite a few construction articles, going from simple to quite sophisticated. So you could build a panadaptor to check out the adjacent channels, and a receiver to monitor channel 9 (when it became a designated emergency channel) and even a grid dip oscillator for "Class E CB" up at 220MHz, even though that service never came to pass.

THere is nothing unique about the description. I can't recall seeing much in just tuneable CB receivers in the hobby magazines from that time, but it sounds like a relatively generic receiver (and he did say receiver, not transceiver).

If it is a CB receiver, there's nothing to guarantee that it was built from a description in a magazine article, or that it's a direct copy of something. Someone could have made it up, or copied something else with mods for CB. Afterall, no matter what the unit is, someone has to create a unit before they can write it up in a magazine, so something can exist without a magazine writeup.

And given that he says it's a receiver, if it was a commercial unit the pickings are slim. I can think of only one manufacturer that made a standalone CB receiver.

In the early sixties I ordered one of those cb kits from an
electronics magazine. It consisted of a crudely punched chassis, a bag
of parts and a schematic. I never did get it to work.

Where are these "personal slights"? I offered to help publicise your idea.
I've prepared some space to do so or, if you prefer, I will publicise a link
to a website you can set up yourself.

So come on, "get baking those biscuits" or I suspect some will conclude your
idea was the hardware equivalent of "vapourware".

Certainly Heathkit got around the issue with their full blown CB set(s)
by having the transmitter arrive as a preassembled module.

But I thought there was a CB "Benton Harbor Lunchbox" for a while,
and I can't imagine they would have a module for such a low end
unit.

So perhaps the type acceptance came a bit later? I can't remember (not
that I was aware of such things at the time, but I have read lots
of back issues of magazines).

In the very early days, there was equipment being made out of people's
garages. So either the rules were more lax then, or from the outside
there were companies selling things that weren't legal.

It may be now, I don't know. At one time Heathkit put out a kit called a
CB-1. This was a simple CB and not at all like the one being talked about.
There may have been others, but this is one I know of for sure.

After the way you have treated Gareth over the past few years, do you
really think he is going to accept your charity now? You're in cloud
cuckoo cuckoo land if you think he will!

And, I'm sure I'm not alone in thinking that your sudden change of heart
has some ulterior motive! It's not difficult to get free web space and
if he wanted to continue with this, I'm quite sure he could do it on his
own, and without you constantly harping on trying to score points!

--
ARRL membership = $39 (~£20)

There was a period, long, long ago, when CB was young, and I was not
yet but a leering glance, that building CB gear was okay.

It stopped being okay before the explosion of the mid-70s.

Lawrence Statton - lawrenabae@abaluon.abaom s/aba/c/g
Computer software consists of only two components: ones and
zeros, in roughly equal proportions. All that is required is to
place them into the correct order.

There were a number of kits as I remember. Heath had several, as did
Allied (Knight Kits). These could be at least as sophisticated as the
mid-range factory units of the day.

Are you talking about the dual-gate MOSFET used in some Yaesu
equipment?

I think the GR suffix in that case has to do with selection for low
noise and low intermod.

Tim.

The tube lineup is from the later generation of miniature tubes - which means mid 60's. It looks like the first conversion oscillator is crystal controlled and the receiver uses a tunable if stage - similar to Drake. That means it would be easy to change thr crystal controlled first conversion stage and cover any other range. Might be a good 10 meter receiver - or perhaps the 12 meter band. There could be some value to a cb collector, since few home brew receivers were made.

One of the pots might be noise limiting adjustment, or one could be for a Q-multiplier.

Didn't one issue of like an RCA Tube Manual - have a schematic in it for a
cb receiver or "transceiver"? I know I've seen them out there.

1289. help needed on hi-V power supply circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-20 04:18:10 UTC
From: "Ross Tucker, NS7F" <rjtucke@gmail.com>
Message-ID: <1177042690.411155.283850@y5g2000hsa.googlegroups.com>
Source record: 7677
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

A little over a year ago, I posted a request for help (1) in designing
a circuit to get 300VDC out of a power supply that was pumping out
~520VDC. I got many helpful replies, but unfortunately, I was unable
to complete the circuit. I now have three transmitters (2,3,4) that
would like
a nice source of high voltage and I must now admit that I really do
need your help in completing this project.

I own a really nice, heavy transformer that I'd like to use-
unfortunately, the voltage is a bit too high- it puts out ~520VDC
(after a 3-pole filter 10uF/10H/10uF with 40kOhm bleeder
resistor). I am looking for some ways to bring this down to the
voltage I need.

Although I consider myself a competent builder, I am unfortunately not
much of a designer - this is what has prevented my progress for the
past year! I own the '05 ARRL handbook and Art of Electronics, but I'm
just not comfortable doing this myself. Specifically, telling me the
type of transistor/tube and not specifying the part number or an
article describing a similar HV regulator would leave me somewhat
stranded. I know I'm asking a lot here -- please understand that I
am immensely greatful for any of your help!

Here is my specification / wish-list, in decreasing order of
importance:
* produce ~370Vdc at 120 mA
* cost less than $50
* not require modification of the transformer
* also be able to produce ~240Vdc at 40 mA
* also be able to produce ~300Vdc at 70 mA
* be hollow-state
* be elegant

ISTR:

- Heath equipment was acceptable contingent on being assembled
according to the instructions. There was a notice in some of the manuals
about that - ISTR some devices where one part was a Part 15 label which
the builder was to sign & date & stick to the completed kit certifying
they'd followed the instructions.

- It was legal to homebrew CB gear in the early days of the service, but
that rule was changed - well before the 1960s. (I'm not sure it was
ever legal to homebrew 27MHz CB gear, it may have only been legal for
the old 470MHz stuff)

It may not have been in the US, but before regulation and since deregulation, one can build up to 5 CB's and call them prototypes in .ca land, as long as they meet Industry Canada (then the Department of Communications) specifications.

Maybe it's a Canuck rig?

Cheers,

That's logical.
But just to nit-pick! :-)
Got one of those ceramic tubular adjustable slide resistors. Rated at
300 watts IIRC.
If I put the slider half way along I will have half the resistance
wire in the circuit and dissipating heat at full current rating;
correct?
But still the same thermal mass of ceramic and metal. So could one
perhaps argue that it might be 'slightly' (very slightly perhaps) a
little more than half the power rating. Probably nothing to have any
effect whatsoever in practice because one would not run a component at
maximum rating at any setting anyway?

> to join with _REALISTIC_ non-nugatory support?

I am sure that many people would be happy to join in the project, once they see that you are serious about it and have a good idea of the scope that you intend. Why not sketch out some rough ideas, block diagrams suggesting which biscuits would be needed initially (ideally I'd guess some building blocks which could be useful in their own right - e.g. VFO, amplifiers etc.), together with a proposal for how they should connect together - some kind of standardised backplane, a connector stack arrangement similar in concept to PC/104 (http://www.pc104.org/technology/PDF/PC104%20Spec%20v2_5.pdf), something different entirely?

What are you really thinking of here? Is it as simple as "every biscuit shall be either a Xcm * Ycm, or half sized X/2cm * Ycm" and allow free reign on electrical interfaces, or try to work out some kind of standard for general interface levels and protocols between biscuits?

How do you envision the project being managed? What kind of collaboration methods would you use?

The idea is sound, but to spark enthusiasm perhaps you should offer a little more than "Hey guys, let's build a radio". Collaborative projects either need a strong lead or a good previous track record of similar work. Even then take time to get going until people can see where you are heading and that they agree with it and feel they can be a useful part of the project. Throw some basics together, put a bit of flesh on your proposal, and I'm sure you'll get more people interested. It may well end up being you doing it on your own until the first biscuits are designed, but then it should gain momentum. Regularly publish what you are doing and where you are up to; a simple technical report and ignoring those who would shout you down (or a simple technical response, not falling down to "stupid boy" name calling) should gain you support.

Building a CB 'receiver' from a kit can't be illegal.

Do you need to have all three voltages simultaneously?
How good a regulation do you need?
How much do the current requirements vary on each voltage?
Will your supply support 570 volts at 230 ma?

If the currents do not vary much, then why not use a different resistor in series for each desired
voltage? e.g., 1666 ohms at (at least) 24 watts, 10750 ohms at (at least) 17.2 watts, and 3900 at (at least) 18.9 watts. For confidence you might wish to use a 50 watt resistor for the first and 25 watt resistors for the second and third. You could have different voltage terminals for each desired voltage. If the voltage decreases under load, then change the resistance calculations.

As a first, simple, experiment disconnect the 10uF nearest the rectifier and reconnect it in parallel with the other 10uF. Then see what DC voltages you get when drawing currents between 120 and 230mA. If it is near enough to the 370v you require, then add suitable resistors to deliver the other supply voltages and currents you've specified and you've got what you need.

==========
Suggest you have a look in the ARRL magazine QEX ,July/August 1999 ,
pages 51 through 55.
"A regulated 2400V Power Supply" , by VE6AXW

In this supply unit the output voltage is controlled by silicon
controlled rectifiers (SRCs) in the primary (120 or 230 V) winding

The principle of this scheme can be readily used for your 370V-DC power
supply .
The output voltage can be set to any voltage lower than the one provided
by the rectifier(bridge) in the secondary winding at the full supply
voltage to the primary winding.

For the other 2 lower voltages you need you can use a zener diode
/resistor arrangement with or without a high voltage (use low cost 1500
V type)transistor if you really need a constant voltage at varying load.
Otherwise the lower voltages can be obtained from resistors, as per a
previous message in this thread.

The transformer must of course be able to supply the total current you need.
If you don't know the max current which can be drawn from the
transformer , you first measure the no-load output voltage and
subsequently load the secondary winding with suitable resistors until
the voltage has dropped by 5% The relevant current can then be taken as
the maximum for the transformer (practical approach)
The max current check can of course also be done with the
rectifier(bridge) connected (DC measurement)

Funny, coming from someone in a country that invaded Iraq in WW1, 1941
and basically set up the whole region to become what it is today.

Blame can be cast everywhere, how about casting some solutions for a change?

I have long suspected that "Smiffy" is the name by which
Mr.Nugatory posts when at school, with carefully checked
spelling to put us all off the scent.

The times of posting by "Smiffy" since appearing last November
are commensurate with that of a school-teacher.

Both the subject matter and also the style of language, (in
particular the condescending manner of an arrogant and
deficient personality), in the below are so similar to that
of Mr.Nugatory, that I am now convinced that "Smiffy" is,
indeed, none other than our very own Mr.Nugatory, M3OSN!

What better way after running away and hiding to sneak
back in under an assumed ID?!

Back in the '60's - I was building AM broadcast transmitters, not CBs - however - here in ought 7 - I have a 1962 Allied catalog in which the back section is a KnightKit catalog. On page 408 there is a C-11 Citizens Band Transceiver Kit ($39.95). It transmits on any 1 of 22 CB channels depending on crystal installed, and it manually tunes all 22 CB channels. It does not list the tubes, but does note it's a superhet.

On the next page is a model C-27 Deluxe Transceiver Kit - for reception it too manually tunes all 22 channels - plus has provisions for two crystal controlled channels. The same switch also selects one of two transmit frequencies. This is a dual conversion receiver, and while it again does not list the tube compliment - it does say "7 dual-purpose tubes, 2 single-purpose tubes, VR and rectifier". Since it mentions regulated supplies for the oscillators, pretty sure that's the "VR". $79.95 plus 2nd crystals - $1.95 each (transmit or receive, specify channel).

best regards...

I posted a helpful reply, with some useful suggestions and a request for more information about your technical and project management expectations. This is _your_ project, how do you envisage it working technically, how will you raise enthusiasm from volunteers and and how will the project be run?

Those are serious questions, that anyone interested in collaborating with you would want an answer to. You are asking for potentially a lot of investment in time from others, which many would freely give if you can show that you too have the commitment to follow through. At the moment I see nothing more than the glimmer of a potentially great idea from you. Will you drive it forward to a successful conclusion, or will you let it drop complaining that no-one would help yet rejecting any suggestions you get?

Why not re-read my words below in a calm manner? They were not written in any kind of vindictive or spiteful manner, they are purely intended as constructive suggestions from someone who has worked on many collaborative projects involving people who live far apart.

Thanks for all the replies.

The chassis is very professionally done. The wiring is not so well done. The filter cap wiring on the transmitter socket divider is a joke. Thus the idea of a kit seems reasonable. There is only one crystal socket. So the Knight Kit seems to be out. Family issues are keeping me from more work on the rig right now, So I'll have to just wait see what else is posted here, for a while before trying to draw a schematic

I really am impressed by those that want to help, plus I've learned some things.

Thankjs again.

Jim

What about that old Hammerlund CB...was it called the HQ-105? or
something like that. Possibly someone put on a different front panel
and it now looks to be homebrew?? Just a thought.

Hi Terry

That's what I was wondering, the mass of the heatsink
the windings are on should have a bearing on
the wattage... Lacking manufacturer data I guess it
is a moot point and I'll take a conservative tack..

I second dropping the first filter capacitor. It will lower
the voltage and reduce the strain on the power transformer
as well.

The manufacturers, all I've ever seen, take that conservative tack and
just put a maximum current rating on them. In the case of a rheostat,
you need to consider the rating of the slider, and I'll bet you get
longer slider life if you adjust it when the current is zero than when
it's the full rated value.

What Terry wrote has a lot of merit. In fact, with the tubular
ceramics with a hollow core, you could quite reasonably get more
dissipation with a given temperature rise if you orient the resistor

vertically in free air, as opposed to horizontally, since it acts like a stack and will get considerable air flowing by virtue of the heat. If you REALLY wanted to optimize such a resistor, you'd space the turns further apart on the end that was going to be on top! Also, I can tell you that little 0603 surface mount resistors, nominally rated at 1/16 watt, can dissipate a whole lot more (1/4 watt!) than that if you keep other heat dissipators away from them and provide wide copper paths to lead the heat away from them; but on the othe hand if you put a whole mess of them as close together as your design rules let you and ask each to dissipate the same power, you'll find you may not be able to go above 1/100 of a watt each without getting them too hot. So not only does the amount of the rheostat in actual use make a difference, it makes a difference how you cool it. Turn a fan on it and don't adjust it while it's got current through it, and you MAY be able to safely add 40% over its current rating. YMMV, though. You know what to do to be conservative.

Cheers,
Tom

Let's start at the beginning.

You have a power transformer and a rectifier, followed by a C-L-C
filter (aka capacitor input). And you're getting a bit over 500 VDC
from it.

1) What rectifier circuit are you using?

a) full-wave center-tap
b) full-wave bridge
c) voltage doubler
d) some other type (specify)

2) What sort of rectifier(s) are you using?

a) High vacuum diodes (5U4G, 5Y3GT, 5R4GY, etc.)
b) Solidstate silicon diodes (1N4007, etc.)
c) some other type (specify)

3) What are the transformer ratings, part number, etc.?

4) Which of the listed transmitters have you built?

It may help to post the date codes from other components
and also make, model and manufacturer of your device.
At first glance the 'top markings' look like a house number.
Also, what is imprinted on the underside of the device?

Generally, 6 pin DIPs are optoisolators.

There must be exceptions, but every time I see one I start
with the assumption that it's an optoisolator.

I think the second choice would be a pair of transistors.

I vaguely remember Motorola's odd, short-lived
line of linear devices back in the 60s or 70s..
MFCxxx rings a bell. They had attenuators, oddball
audio amps. I think there were some six pin devices,
but they were also an offset lead package.

I have 8 of these, raw chips, not part of an assembly. There are no
other markings.

For general information on "first CBs:"

The September or October, 1958, edition of Radio and Television News magazine (available then at most newsstands) carried the news of the opening of Class C and D Citizens Band service. The month was probably October since the news was on one page of "latest news" which went to [printer's] bed the very last.

The March, 1959, issue of Radio and Television News carried an article by Don Stoner as a how-to-build CB voice transceiver with full plans, parts, etc. That issue was popular in the southern California aerospace community at the time with many attempting to build it but few succeeding in getting a working unit. Don Stoner was one of the frequent authors in the popular magazines of the time, would later team with Pierre Goral to form SGC [Stoner-Goral Company] in the Seattle area. Both are SK but SGC lives on.

A number of copy-cat kits went on the market soon after, most being variations of Stoner's article. My own experiment was a converter for an AM radio as a receiver, similar to Stoner's "Q-Fiver" other-magazine article on an HF converter for a WWII surplus ARC-5 Command Set LF receiver. While that succeeded for me, the transmitter part didn't work well, a result of my ignorance in low-power RF design for AM stages at the time. Several months later I bought an E.F.Johnson Viking Messenger CB transceiver and used that in an aluminimum-body Austin-Healey sports car (ideal ground plane for mobile).

Since the FCC did not specify type-acceptance per se on CB transmitters until years later, nor directly say that "home-built" transceivers could not be used, the first two years of "11m" CB was an open field to play in and there were many variations. In that shake-out time, general design of first transceivers was a single-conversion superhet receiver with crystal-controlled LO, a 3rd-overtone crystal oscillator to a plate-modulated power amplifier for the transmitter, AM from using the receiver's audio output stage as modulator. AM was generally "down-modulation" with carrier going from about 1.4 times quiet CW level to zero, more a result of tube stage saving and low-level drive to the PA. It was one pair of crystals per channel, the expensive part of operation; surplus quartz crystals from WWII were available from many small shops at the time so it was not a great barrier. Mobile operation required the old "vibrator"

supply, always a troublesome thing for any mobile equipment needing HV from before WWII until after. Power-transistor multivibrator switching supply substitutes for vibrator supplies was not good due to (generally) horrendous spikes and RF hash generated by early power transistors and diodes with insufficient switching times. Still, it was a fun time of experimentation for thousands of home-brewers then.

Frequency synthesizers for "all-channel" operation didn't appear in quantity until designs went solid-state. A few tube designs used "channel-bank" mixing of two crystal controlled oscillators to cut the number of crystals needed, an architecture carried on when CB went to 40 channels in 1977. In the 1960s the lower-cost off-shore-made CBs hit the market and were a hit with truckers on the interstates; the FCC tossed in the type-acceptance rule and that pretty much reduced the CB home-brewing projects.

Although the FCC required licensing of 11m CB in the beginning, there was never any associated test and the "license" was a pro-forma Third-Class Restricted Radiotelephone type, similar to what was required of private pilots using civil aviation radios. Through some oversight, the FCC assigned license call-signs with a prefix of "11W," this got them in trouble with the ITU and international agreements. For a brief period CB licenses were issued with "K" prefixes before regulations removed the need for licensing.

For illustrations of early CB, go to www.retrocom.com, a large website of stories and pictures of CBs.

Were them "CB callbooks? Does anyone have them? I had a CB license in
the "K" era (circa 1979). and have long since lost it. I would like
to look up my call.

Geoff.

Found the following on the NTEINC web site.

Replace part.... With NTE part.... Product Line Data Sheets
Notes
65-01 NTE3040 Semiconductor

NTE3040
Optoisolator
NPN Transistor Output
6 lead DIP

1 -- Anode of LED
2 -- Cathode of LED
3 -- NC
4 -- Base of output transistor
5-- Collector of output transistor
6 -- Emitter of output transistor

That was a a really weird line. I seem to recall some were actually
four pins. They seemed for much intended for consumer equipment, and
it seemed like they tried to fit the package to the device, rather than
have something like a 14 pin package and have everything fit in it no
matter how few pins they actually needed.

I think some of the line included dividers that would run off 12v,
intended for music organs.

I honestly did not include those in my "there must be exceptions".
I'm not sure now if I put that in just to be sure, or I was thinking
of something (that I can't remember at the moment) that do come in 6pin
DIPs.

Hey all,

Would an air-gap tuning capacitor intended for transmitting hook up any differently from an air-gap tuning capacitor intended for receiving? I built a project following the schematic for a commercial product, but the (intended for transmitting) capacitor doesn't like being hooked up with the stator grounded. Can't figure out how to make it work the way the schematic is drawn, so I ungrounded the stator and take the input for the amplifier from there instead of the rotor. And doing this, it works fine. Anyone have any input? I'm all ears...

Thanks,

Dave

Its not the cap. The main difference between receiving
and transmitting variable air capacitors is the voltage
rating. Since transmitting capacitors are made for higher
voltages they have greater plate spacing and consequently
larger plates for the same capacitance. without seeing the
circuit I can't guess as to what is wrong.

No difference on the hook up question.

If you ground the stator the the shaft to the rotor will be "hot" and
that is probably your problem.
You can operate that way but you have to use an insulated coupling on
the shaft to the rotor.

Depending on the use, even that might give you trouble.

Most air variables are rotor grounded,,,stator floating ...Frame
grounded same as rotor.. HS

The stator assembly is usually insulated using a ceramic like insulation, or phenolic. It is normally the "hot" side of the capacitor. The rotor assembly and shaft are usually part of the frame, and is grounded when mounted to a metal chassis.

What is the circuit, and why would you want to ground the stator
instead of the rotor?

> Can't figure out how to make it work the way the schematic
> is drawn, so I ungrounded the stator and take the input for the amplifier
> from there instead of the rotor.

I'm not sure what you mean.

Most variable capacitors, transmitting as well as receiving, are
designed so the rotor is connected to the frame of the capacitor.

If one side of the capacitor is to be grounded, it is almost always
the rotor, because that means the capacitor can be mounted directly to
the chassis and the rotor shaft doesn't need an insulated coupling.

If neither side of the capacitor is to be grounded, the rotor and
frame must be insulated from ground. That means the capacitor can't be
mounted directly to the chassis and the rotor shaft needs an insulated
coupling.

> And doing this, it works fine. Anyone
> have any input? I'm all ears...

Need more info on the application and the circuit.

Thanks, all, for your input RE: the rotor being normally grounded to frame, etc. This makes sense, as the rotor has threads for a nut to fasten it in place against the chassis/case. Please don't take my silence as not caring/listening-I'm fiddling with it trying to understand what I have in my hands, and how to make it work. *All* of your input is greatly appreciated. Each and every one of you. You have the experience I lack, and I value your feedback.

Trying to put it all into action...

Quite A number of (Years or Moons ago) depending on how you keep track of time, someone came to one of the hamfests in Gaithersburg, Maryland, in a large box
type of truck, and mounted on top of the truck was a CAPACITOR CANNON of sorts.

I think that I need to clarify a bit - apparently the capacitors did not really explode, but SNAPPED IN DISCHARGE STATE causing a louder than life noise, and could be recharged to do it continuously.

At a push of a button this object sounded like a number of VERY LARGE CHERRY BOMBS going off in succession.

Yes - it was an attention getter.

Does anybody else remember this device and or have a schematic for it?

The electronics department at Sierra College is moving into a new building that eliminates our need for our two sets of PCB etch/developer tanks. One set is "stock" Kepro and the other has been modified with industrial pumps and nozzles for short run production service.

One set is still in service and won't be available until mid-May. The stock set is on the shelf and available right now.

I'd PREFER to give them to another school or ham radio club for "public" use, but it is first come, first served. The etch tank and developer tank are both the same size and about as big as two desktop computers side by side each. 110vac.

Sierra College is in Rocklin, 30 miles east of Sacramento. Pickup only, no shipping.

I did a "get directions" on Google Maps. "Leeds UK" to "Rocklin California".
Apart from a side detour via France, direction number '38' looked a bit of a
killer, so I won't bother ;)

My next project is an RF exciter for my 8000 rig.

For sentimental reasons, an 807 must be part of it.

In browsing around, I find the Viking Adventurer to be just about what I want to do. I found the schematic on BAMA but they do not seem to have the parts list which would save a lot of trouble.

Does anyone have this or know where I can get it?

Thanks,

Well - I would like to thank everyone here and off line - who submitted a story about getting rid of power line noise, transformers & other hardware falling from top of poles, bottles exploding, etc, but nobody has answered my question yet!

What I am looking for is the object described, to make NOISE. Not interference type of noise on a receiver, especially during contests and the like, but as an attention getter!

Also, this unit would have NOTHING to do with cannons or other types of units set to actually explode say "gunpowder or the likes" that would cause a harmful explosion to damage any person or property!

I have a specific need for an item as of such!! Originally I said that it might sound like a bunch of Cherry Bombs going off, maybe I should rearrange the wording and say it sounds more like the noise coming from the muzzle of a machinegun!

I built one of those for my first station (in North Dakota) in 1955.
I rewired it to use a 6146 about a half year later. I wish I had
kept it. but I have no recollection of what happened to it. I got a
lot of use out of it- added a Heathkit VFO , a homemade AM modulator
(constucte on an over turned aluminum cake pan) and a amplifier with
four 837s in grounded grids. Damn near electrocuted myself on that
amp. I don't have a manual any more - sorry. Just a moment of
nostalgia...

Good luck.

1357. How to set tuning on Sony car stereo from Japanese to US tuning...please help

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-04-25 06:09:14 UTC
From: gggoattt@aol.com
Message-ID: <1177481354.733638.44130@n15g2000prd.googlegroups.com>
Source record: 7646

I need to set the tuning on my Sony car stereo from Japanese to US tuning; service manual?

Hi there...

I was wondering if someone has any idea if ANY of the Sony "WX" series of double-din car stereos (japanese or usa models) can be "hacked" so that their tuners can be changed from japanese fm tuning to us/uk or world band tuning and vice-versa???

I recently purchased a Sony WX-C88REC double-din cd/md recorder from eBay. This is a japanese market deck and is factory set for japanese fm tuning. However, the design and physical layout of this deck is very similar to other US models (such as the WX-4500X and the WX-C5000, as well as the WX-C55 which looks nearly identical). I'm nearly convinced that there MUST be some way to hack the japanese models so that their tuners can be "switched" to us or world tuning. I find it difficult to believe that Sony would design two distinct different tuner hardware modules for japanese and american versions. Problem is, I have no clue HOW to "hack" this feature. I don't have a service manual for ANY "WX" series stereos, but I'm thinking that it may possibly be an option in a service manual for ANY of the "WX" decks. Again, I find it difficult to believe that this isn't "set-able" some sort of way.

Does anyone out there have an idea? Does anyone out there have ANY service manual for ANY "WX" series Sony stereo? Or, for that matter, does anyone have a service manual for ANY Sony car stereo that addresses in ANY way setting the tuner for different bands?

I realize there are adapters available to transpose the FM frequencies. I've used them before, always with poor results (stations usually overlap and are weak). I mainly record off the radio with my MDX-C800REC's in my other cars, but always thought it would be cool to be able to dub cd's quickly in-dash digitally without having to mess with a cd changer. But, radio recording is my primary concern...and the adapters don't provide the quality I want for recording.

PLEASE help ANYBODY if you can steer me in the right direction or help in ANY way. If anyone has ANY Sony service manuals for ANY stereo, please let me know...perhaps if setting the tuner IS an option, maybe it is a standard procedure to set ANY Sony stereo's tuning in a similar fashion.

Thank you VERY much!
Jeff

Jack,
How about getting the Viking Adventurer Manual?
You will still need a VFO.

Hi'ya Jack,

My Viking Adventurer is on the air nightly. In fact for over 2 years it has been my "primary" rig and that is using only crystal control.

I am sure you can find the parts list on BAMA but if not send me an SASE (via my QRZ.com address) and I will photocopy it for you.

Good luck.

The likely reason is that the FCC considers the device a CB power
amplifier . Lately this federal agency has stepped up its combat against
the sale of these illegal amplifiers.

Some time ago a US road side truckers-centre selling illegal devices
was heavily fined.

Considering his retail outlet, Ebay, has blocked every attempt to sell
the product, His sales has probably been rather low. Thus not
profitable. Also the fact that the amp is rather low powered for most
"competition" CBers and with the plethera of older 100+ plus ham rigs
out on the market, there is not a large market for his amp. Who needs
an five watt radio, and a 100 watt amp to drive a big competion amp
when you can get a Kenwood TS440 or similar and use it.

The Irvington High School Science Club is announcing the creation of a New High Altitude Balloon group. High Altitude Balloons are Helium filled latex balloons that fly at altitudes higher then 85,000 feet (some make it to over 140,000 ft). Amateur Radio is used to track the balloons during the flight and after landing The group will be called "New York Near Space Research" or NYNSR for short and will be conducting flights by late Spring next year in the Lower Hudson Valley. We are hoping to have a website purchased by the end of this weekend and have some more information available. We have started a public Google group under the name New York Near Space Research already and you may join if you like.

Hadn't thought of the vertical Tom. But good point. I do recall years ago, seeing vertically mounted ones used as stage light dimmers, now that you mention. Fans good idea too. While all of this was a reaction to the original basic question; interesting how one idea leads to another, eh?
Regards.

1376. Computer Grade

Newsgroup: rec.radio.amateur.homebrew

I keep seeing caps described as "computer grade" but a search for a definition comes up with zilch.

What does this mean? As the vast majority of computers are owned by the masses, one could assume it means sleazy consumer quality. Or it could mean the kind of computer that prevents ICBM's from being accidentally launched.

Which is it?

The name has been around for much longer than PC's, so I assume that it
means _mainframe_ computer grade -- today we'd say "server grade", I guess.

At any rate, if it has no legal meaning then it could be a total lie and
no one would be subject to any legal penalties (marketplace penalties
are another matter).

I have always taken it to mean _really_ _good_, but you'd have to go
over the specs to see, then extend some trust to the manufacturer.

Hi,
I have just acquired an old home brew radio. It is a 5 tube
regenerative receiver. The tubes as best I can make out are
Cossor 215P BVA, Mullard PM1HLx2, Mullard PM2DX and a Mullard 2M1HF.

Does this ring a bell with anyone. Does anyone have or can point me to
Schematic.

Many thanks
Ian

The term was around in the early seventies, at least. That was when
solid state was still relatively new, and electrolytics were not
as advanced as nowadays. I built 1A power supply in the fall of 1972,
and had found at a hamfest a "computer grade" electrolytic, in a
metal can,10,000uF at about 20 volts. It was about the size of a Coke can.
It was pretty massive in terms of capacitance at the time, the regular
electrolyitics were hard to find in such large values, and even this
one was barely sufficient in terms of voltage rating.

It was obviously surplus, from mainframe computers. I have no clue
whether they were particularly better than the regular electrolyitics,
but they were obviously the source for larger value filter caps at
the time. I'm sure some of it was merely hype, at the very least
"computer grade" says where the capacitors came from.

It's obviously different now. I can easily get 10,000uF electrolytics
in a far smaller package and with a bigger voltage rating. I haven't
evne noticed the term in a long time, other than the occasional question
about the term (it has come up before here or in one of the
sci.electronics.* newsgroups.

There obviously are different grades of electrolytics, with things
like temperature rating being important in some applications, and ESR
being important in others (especially things like switching supplies
where they have to deal with higher frequency waveforms). But
the talk is in terms of their specs, rather than some mythical
"computer grade" capacitor.

I'm a professional electronics engineer (not rf enginneer though), and what I really find frustrating about radio projects is the uncertainty!

I spend hours designing and analysing filters. Designing oscillators and minimising harmonics, noise etc. Then I cheerfully commit it to a PCB (I tightly laid out surface mount PCB to minimise layout inductances etc).

Nothing ever works as simulated. Transistors never have the rf gain as SPICE seems to suggest.

And local oscillators...well carefully chosen components just get thrown out the window to be replaced by more and more random changes in component values.

If it does finally work, I'm left feeling nothing like an exacting engineer, and more like an artist that has piles on layers and layers of oil paint till the right effect was achieved.

I now find any mention of the 612 mixer and its (non)osclillator gives me panic attacks. (well i'm currently trying to get it to work at 130Mhz with voltage tuning).

So I wonder, what would be your top tips for someone moving into the radio design arena? Are there hidden secrets that nobody tells and the books omit? I'm not thinking about PCB layout here, more things like, are simulation programs of any use (if so which ones) and what kind of design procedures can result in predicatable results?

* Model your parasitics, including circuit-layout induced ones.
* Remember that _everything_ has parasitics if the frequency
is high enough.
* Transistor models are never perfect; you need ones intended for
use at your frequencies. RF transistors should have models that
include package effects.
* Tightly laying out your circuit board will reduce inductances
but increase capacitances.
* There are (very spendy) packages that will do parasitic
analysis of your PCB layouts that you can then run through
spice.

It is an art, and one that I haven't mastered myself, but you can put a
lot of science into it if you're careful.

I first ran into computer grade caps back in the 1970's, back when I was building my first homebuilt computer (before the masses owned computers), I considered it a pejorative, in that it was only good for building power supplies for computers. Would it be be better if it said low voltage dc power supply caps? Those big coke can sized caps made great smoothing caps, along with some smaller caps they could knock ripple down to where you needed an oscope to see it. Just don't build a supply with that as the only cap on the output, they are ok on low freq swings, but also add a 1k and 10 uf cap to help clean up the rest of the ripple.
thanks John.

There is, or was a site on the internet that had these sorts of high energy items. Tesla coils, magnetic coin mashers, capacitive discharge banks (which sounds like what you are describing) etc.

Basically you are going to charge up a whole passle of high voltage caps then short the output so that you create a minature lightning bolt, thus the boom. Too dangerous for me. Not to mention the amount of magnetic pulse you are going to let off right close to the audience's cell phones, laptops, handhelds, etc. I wouldn't want the bill for repairing everyone's electronics after you scramble them.

thanks, John.

I am a real _amateur_ ham operator. I _love_ to make homebrew stuff but with tubes (not solid state), and will offer MY version of your story.

> I spend hours designing and analysing filters. Designing oscillators

I do tinkering (not _engineering_), and do pretty sloppy, ugly, breadboard construction of:

1. the real thing
2. only a small part of the whole project at a time
3. turn on "the juice" for the smoke test: results: 1-smoke and no action (then scratch head), 2-no smoke but action (cigars for all), or 3-no smoke & no action (also scratch head). There are variations on this. Beyond the scope of this post.

> Nothing ever works as simulated. Transistors never have the rf gain
> as SPICE seems to suggest.

Decades ago I built, in a physics research lab on a university campus, several dual-delay line pulse amplifiers (5-6 tubes, fancy delay lines). All identical parts, identical schematic, identical tubes. One of these amplifiers put out a trailing spike that was not supposed to be there. I tried everything to figure out where it came from. I spent weeks on this. Finally, I put in a bypass cap that was not supposed to be there and that fixed it. Told the boss about all this. He shrugged his shoulders.

> And local oscillators...well carefully chosen components just get
> thrown out the window to be replaced by more and more random changes

I have found commercially made components that were crap. eg. Precision resistors 20% off value. Parts dead out of the box.

> If it does finally work, I'm left feeling nothing like an exacting

The object of the game is to get stuff that works and forget the castles in the sky. Oh, yes, I worked at a place where another guy--making very

very very fancy-schmantzy stuff--built a circuit according to "plan" and it didn't work either. Much cussing, grunting, cussing, yelling-and-shouting-and-huffing-and-puffing and in the end, I recall that they pulled a kludge fix, too.

I don't know about _you_, but for me, I do better when I build small parts of the whole thing, then test them individually, and I have minimum test equipment (oscilloscope, meters, signal generators) and you can put inputs, measure outputs, measure voltage & currents, and tinker and adjust as you go.

You sometime have to test the part separately from the circuit to actually prove to yourself that it really does work. Its a big pain, but it makes you check everything.

You might ask yourself if you are assembling things with good techniques (yes--I kid you not--I have actually run into people who did not know that you had to strip the insulation, whether enamel or plastic, off of wires before putting them into sockets or clips) including soldering technique.

Oh, yes, since I work with tubes that run hundreds of volts on the plates-screens, yes, I've gotten a few electrical shocks (they hurt, and at higher current, burn flesh) but also be careful about not having a finger from each hand in contact with "hot" metal conductors. High power RF also burns flesh and feels like heat rather than pain and you might smell burnt flesh (its terrible) before you feel anything.

Excellent...!! Professional engineers also spend a lot of the time in
the lab waving their arms in hopes that they can dissipate the smoke
before someone runs in to see where the bang came from!

I dont mean to be too highbrow...its just Ive spent so much of my
working life ensuring that if you build something on a production line
100,000 times 5% failure is pretty bad. And people obviously build
small transistor FM/AM/shortwave radios in china with the worst cheap
components...and most of them seem to work of sorts. Though i have
designed high end audio amplifiers and each time a new batch of
capacitors came in there was lots of "listen tests" as amazingly you
really could here 100nF placed on a supply line (dont ask me how...I
still dont understand it).

If the pro rf engineers do too much of the "try it and see" approach
they deserve their sky high salaries for the loss of hair and frayed
nerves waiting for the customer returns from their first 10,000 units!

I did wonder whether selling the car and buying some impressive test
equipment would make me feel better ;)

Look up Marx Generator on Google and see if that descibes the circuit.
Often used to simulate lightning discharge.

$200 at local hamfests and some cheap gear will get you most of what you need. I bought a decent audio gen for $15, a decent RF gen for $3, and an old tektronix scope for $45 (but it crapped out just recently [or, I should say that it craps out after it warms up]). I do fine.

I have a couple of ADSP-2181's burning a hole in my junque box. Yes,
I know they're a little slow and 'dated', but they were free and I
thought they'd make a nice platform for a learning project, perhaps
an
IIR or FIR SSB filtering scheme.

Any of you done any designs with this, or have any non-proprietary
app
notes for this device?

In the 1960/70's computers were the only application requiring very
low voltage stabilised DC power supplies, +5 V for TTL, +6 V for DTL
and -5.2 V for ECL. Other high power DC applications in those days,
such as industrial automation, used 24 V, but relays weren't sensitive
to ripple or voltage variations.

When a typical computer consumed several kW at 5/6 V, quite huge DC
currents were required and thus the power supply capacitance in linear
power supplies had to be huge.

I have seen this "computer grade" term used in the 1970's when some
surplus companies tried to sell some huge size capacitors, when
physically smaller capacitors became available with the same
capacitance, in order to justify the size of the surplus units.

But after the 1970's I have never seen the term "computer grade" used.

We dont seem to have places where you can get cheap stuff in Britain. I tried to buy a spectrum analyser from ebay last week, good job I didnt pay it was a con artist. Problem is with kit like spectrum analysers is that you need something capable like an HP, otherwise its can be next to useless. And everyone seems to know the value of an HP856xrange unit, being $4000+!

I did once go to a ham radio show just outside of london, nothing cheap there though. Though I will remember two enthusiastic bearded men who were each looking through boxes of junk at opposite ends of a stand, they had their head in their boxes and were talking to each other on radios..saying "bill theres some good stuff in this box, over", "george..yes Ive found some great stuff in here, over"!

Meanwhile...I have a 612 based colpitts oscillator which on test works at 110Mhz with 10pf base/emmiter and 22pF to ground on the emmiter. But curiously jumps up to 210Mhz when I double the 22pF cap to 44pF. Ive got a frequency counter via a FET buffer showing those frequencies, and (with the counter turned off) I can verify the frequency with my portable scanner set close by. So increasing the capacitance doubles the freq of operation!? I do wonder whether the spectrum has just spread into harmonics...but i cant find them on my scanner...and wheres that HP spectrum analyzer..hmm

If anyone out there knows why increasing the emitter ground capacitor in a colpitts will increase the frequency I would be very happy to be educated! Given that the freq should be the emitter ground cap in series with the emmiter base, in parallel with the inductance. Which is 100nH, with a 1/2PI ROOTLC tuned circuit relationship.

Happy happy happy...

1392. help with multiplexers

Newsgroup: rec.radio.amateur.homebrew

Hi,

Re: array processing / analog to digital cards

I would like to process signal from an antenna array with 8 elements.
Initially I was thinking of using an A/D card to digitize, with 8
input ports for 8 antenna array. Each antenna would have its cable
coming into each port (assuming no RF analog) on to the card

But recently a friend told me that a "multiplexer" can be used to
multiplex the 8 antenna signals into one and piped to a single port of
A/D card. That way a single port (cheaper) card could be used and less
hassle with cabling.

Assuming the bandwidth to be received/processed is 30 Mhz and the A/D
is 70Mhz, can someone pls guide me:

1. Can such processing be done using multiplexers?
What are the drawbacks in terms of losing signal info, etc.

2. What are the important specs/considerations when dealing with
multiplexers in such a setup?

3. Can you recommend a brand?

4. If multiplexers are not useable, can you suggest a cheaper
alternative to buying a 8 port A/D card with 8 a/d chips, etc.

Thanks

Russ

The multiplexer works like a switch: it connects channel 1 to the ADC,
then channel 2, then channel 3, etc. Because you have eight antennas to
sample, it reduces the ADCs effective sampling rate by a factor of eight.

The multiplexer itself won't have perfect isolation from one channel to
the next, and the ADC (and the multiplexer's back end) won't settle
infinitely fast, so if you're switching things quickly you will see some
settling-time induced cross-talk between antennas. These two effects
may be severe unless you spend as much on your multiplexer as you would
on seven ADC channels.

Electronic analog switches like the ones used in multiplexers will
attenuate your signal. A discrete multiplexer using PIN diodes will
minimize this (and be expensive), a multiplexer using monolithic silicon
switches will be worse.

Other than that, and all the stuff I haven't thought of yet, you should
be A-OK.

Oscillators are very tricky to design using tools like SPICE. Most simple oscillators by definition build up in amplitude until the device goes nonlinear and loop gain becomes one. SPICE models outside the linear range are often very poor.

And a very important factor for oscillators, is that we often require that the oscillator start reliably at all corners of the gain/temperature space, but SPICE models usually sit squarely in the center of gain/temperature space. SPICE models for crystal parameters are largely nonexistent or very proprietary and again don't cover all corners of gain/temperature space.

> kind of design procedures can result in predicatable results?

Canned crystal oscillators are a good choice if they really, really have to start reliably. Many handbook recipes for oscillators are not necessarily reliable starters.

Simulation for oscillator design was a laughable concept when I first learned SPICE in the 80's. Today we have more CPU power, but the models are the weakness.

If you are working in the VHF/UHF range, amplifier design usually starts with a transistor model for the frequency range. It's rare to have to get into SPICE.

Tim.

You seem to think that the multiplexer approach will give you something for nothing - it won't. If you replace eight 70MHz A/Ds with one A/D and an 8-input multiplexer you'll have to sample eight times faster - i.e. at a rate of at least 480MHz. What is more, you will need a multiplexer that can switch at 480MHz - i.e. spend only 2ns on each channel. In that time all switching transients - and the signal itself - must settle and THEN, the A/D perform the conversion.

Not mission impossible, but if you need to ask these questions, you might find this project quite difficult.

Greetings:

If anyone has access to the service manual for the Grundig YB 400, I would very much appreciate a look to see if it has pictorial component call-outs before I start a tedious visual tracing effort. (I am in the midst of a controller redesign for this radio). The bulk of the discretes (mostly fine-pitch smt) are on the solder side and I will need to identify the location of Q's R's C's and D's.

Thanks for any help.

Regards and 73,

Michael

Yes, take a look at most amps including the one you are using the antenna
realy is probably nothing special, just a heavy duty DPDT relay.

10p-22p-100nH should run 200MHz!. The 44pF cap sounds a bit dodgy for HF
osc operation.
Oscillator caps I use for the (later version) SA602 mixer are usually
5pF-5pF.
A 110MHz-210Mhz design earlier this year used 5pF-5pF-100nH and 2 back to
back SMV1259 varicaps.
And yes, above about 30MHz concrete account has to be taken of the layout
wiring and parasitics. Modelling will get you maybe 70% of the way there,

invisible factors the other 30% :).
Most important of all is minimising or allowing for the effect of test gear and it's connections. From bitter experience I realise it's a skilled artform that can only be acquired through doing.
And yes, the more test gear the better. Come what may, buy that speccy analyser!.
If you ever come across designs where the author indicates possession of only basic test gear then be wary. Very wary!.

This is really useful. I'd neglected to mention the other 22pF cap in parallel with the inductor(in the test circuit, to be replaced by a varicap with 1nF DC block in actual design), and with circuit parasitics it runs at about 110Mhz. I actually doubled the 22pF cap in the emitter/ground (two 22pF caps in parallel). So one 22pF was 110Mhz, and two in parallel was over 200Mhz! So theres the quandry.

My main circuit uses one varicap diode, can't use back to back as I need the whole cap range. Ive realised that just connecting a 10k pot (in my test circuit) to a 47 series resistor onto the diode (as seen on several circuits on the web) is a bit dodgy as the effect is not linear (presumably because the ends of the 10k pot create a lower rf impedance).

I was also wondering whether my surface mount 100nH inductor has too low a Q to be stable (49). Might be causing some of my more random affects.

Digging out the 1968 Newark catalog, on page 332 are the Mallory CG
series of big can capacitors in a section titled "Computer Grade
Electrolytic Capacitors". ie -10+75% tolerance, -40/+85 deg C temp.
$10 was a lot for a capacitor in 1968.

The switch has to handle not only the 50 ohm input, but the output, whatever that may be. Note that 2kW at 10 ohms is 14 amps RMS, and at RF where the current flows on the surface of the conductors and resistance is quite a bit greater than at DC, you can get a lot of heating with 14 amps. And note that 2kW at, say, 600 ohms is over 1000 volts RMS. At that sort of power level, where you don't really know what impedance you're driving, I'd suggest you should be using a pretty heavy-duty ceramic switch, heavy contacts and wide spacing. I wouldn't even think of using a "miniature" switch in an application like that.

If things stayed at 50 ohms, you'd only need to handle a relatively puny 6.3A and 316V RMS, but if things stayed at 50 ohms, you wouldn't need an antenna tuner, would you?

Cheers,
Tom

At 44pF the emitter feedback factor is only about 0.2 and moving into an
area where a Colpitt may fail to oscillate and all bets are off.
Could be the osc' is running into a on/off squegging mode and the counter is
picking up the 2nd harmonic of a grossly distorted waveform. (a speccy would
show this instantly).
The 47k series R is fine. The diode can see as loading a min of 42k and a
max of 52k, which essentially is a zero load on the dynamic resistance of
the tuned circuit, which may only be a few kohm at best. (a variable R
loading of this nature has only trivial effect on an oscillator)
A Q of 49 is perfectly OK to run the Colpitt. In practice, higher Q's will
offer maybe a 10%-20% increase in maximum attainable oscillation frequency.
The 100nH coil I prototyped was 5 turns of thin tinned wire wound round a
pencil. Doesn't sound much but cost nothing and gave a Q of 180!.

(as an isolated side note, the same coil using Gold plated wire gave Q =180
and the same with Silver plated wire Q=200)

The term "computer grade" is in use today. See
http://www.mouser.com/catalog/629/576.pdf
and
http://www.mouser.com/catalog/629/574.pdf
for examples of those currently manufactured by Vishay/Sprague and
Mallory/CDE.

I suspect that the term "computer grade" signifies capacitors with screw
terminals. However, I can't prove it.

Cheers,
John

1404. 6m amp

Of course one would assume the only time he would use the switch is when working into 50 ohms, either the input to the tuner or the input of a 50 ohm more or less antenna.

"Computer Grade Capacitor" might possibly refer to the low value of internal series resistance and inductance which are important parameters in switching regulator power supplies.

;-) Well, when I read "switch the transmatch in or out of the circuit," I envision switching both ends of it. If indeed it's a switch to select between antennas that don't need a tuner and one that does, where that antenna is always connected to the tuner output, then a more modest range of impedances could be assumed. I'd assume at least 2:1 SWR relative to 50 ohms, though; a typical 2kW amplifier would have a tuned output that likely could handle that range easily. So even then you're getting into possible currents and voltages I wouldn't trust to just any old switch I found kicking around. I do understand that a common ham design philosophy is, "build it with whatever's around and if it fails, rebuild it with something a bit beefier." I'd prefer to put a bit of thought into the anticipated worst-case stress levels before I build it, but that's just my personal feeling.

Cheers,
Tom

I used an amp with 572Bs for many years. With an untuned input, output
ran up to 600W PEP for 100 in.
This suggests that the 811A would work but at some lower power. What
does the owner say about input and output power?

==========
Power amplifiers in the past had untuned input circuits (see above)
because the driving transmitter (with valves in the output stage) had an
adjustable 'Pi-tank' for matching.
However nowadays most driving transmitters (usually transceivers) have a
solid state output stage requiring a resistive load of near 50 Ohms .
So when using these for driving a valve power amp ENSURE the amp has a
tuned input circuit . If not ,a matching circuit will have to be added.
Alternatively the valve power amp can be modified with a simple passive
input circuit comprising an 1:4 impedance transformer and a 200 ohms
non-inductive resistor capable of absorbing the driving power .

I looked through the QST indices and did not see any sign of an 811A
being used on 6M in a construction article. Doesn't mean it couldn't
be done. There was an article in the Jan '69 QST about modifying the
SB-200 (two 572B's) for 6M that might have worked! The 572B would have
similar parasitics to an 811A but might be a little less fussy... but
two tubes would be harder than one (paralleled capacitance) to get to
load up.

hmmm number 1 rule...make sure you're not chasing problems faced by poor test equipment!

Well got rid of the scope probe and used a direct connection with some 50R coax, suddenly I can see the actual oscillator waveform (was completely killed by all 10 sets of probes I pulled out of the box, some are 100Mhz rated). So I now know when its oscillating or not. Also, the 200 odd MHz reading on the frequency meter was caused by an impedance mismatch doubling the frequency. With 50R input on the frequency counter and a suitable output resistor on my oscillator buffer amp I get the correct frequency.

Also I'd made a silly mistake which was throwing me (causing no low mixer output)...I connected a 455kHz IF can filter can across the output of the 612, but the impedance was too low, so it was just hammering the output. With a suitable 1.5kR ceramic filter I can see tuned carriers. (My excuse is that I was suckered into it by having used a similar tuned can on the input of the 612 in the past!)

So...a bit of progress. Still looking out for a good HP spec with 300Hz res band option! Everytime I see a skip I look in hopefully....

Thanks to everyone who provided their thoughts on this...its helped a lot

Also worth noting:

The solid state rigs really like to see the Fly Wheel provided
by even a low Q circuit on the input; a class B amp. will
otherwise see an unsymmetrical load over portions of
each cycle for the driving signal .

1417. Balun Construction :: Did I do this right?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-04 09:49:48 UTC
From: Tehrasha Darkon <darkon@netins.net>
Message-ID: <f1evjs$420$1@news.netins.net>
Source record: 7506
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna

I am trying to construct a broadband 4:1 balun, and I want to double check if my understanding of the measurements is correct before I apply any real RF power.

I do not have access to an antenna analyzer, though I do have an HP4193A Vector Impedance meter and HP8753 Network Analyzer at my disposal.

First I wound the core in a bifilar manner with the leads being labeled A1,B1 and A2,B2. Then I measured the input impedance across A1 and A2 leaving B1 and B2 unconnected. Then placed a 200 ohm resistor across A1 and B2 while tying B1 and A2 together, and measured across A1 and A2 looking for 50 ohms (4:1).

I have also seen a reference to a K value for an indication of broadbandness. K = 1 - L(short)/L(open)

Here are my results...

8 bifilar turns of teflon coated AWG 16, on Type 43 core.

Mhz A1-A2 Open Impedance A1-A2 200 ohm Impedance
2 941 @ +59.5 51.4 @ 3.6 (51.3 +3.2j)
4 2080 @ -25.6 51.7 @ 3.2
7 4130 @ -74.2 52.1 @ 3.7
10 2900 @ -81.5 52.3 @ 4.4
14 1687 @ -84.8 52.4 @ 5.6
18 1180 @ -86.1 52.5 @ 6.8
21 966 @ -86.7 52.6 @ 7.7
25 781 @ -87.2 52.7 @ 9.1
28 682 @ -87.3 52.6 @ 10.2
30 630 @ -87.5 52.7 @ 10.8 (51.7 +9.9j)
---
50 356 @ -87.0 52.8 @ 18.6
54 327 @ -86.2 52.8 @ 20.4 (49.5 +18j)

Inductance Open = .93 uH
Inductance Short = 167 uH
K == .994

I did not intend to operate this balun above 10m, but thought it would be interesting to see the 6m data as well. And it looks like it would work fine there as well.

From what I have read, the open reactance should be at least 4 to 5 times as high as the normal drive impedence. In this case, it is over 12 times the 50 ohm input at 30Mhz and over 6 times at 54Mhz.

So did I do good? Am I way off?
How can I tell if/when core saturation will be a problem?

Hi Teh,

Your numbers suggest Type 75 instead, OR some other mechanism at work.
Given your lead description above is fine, but could have been poorly
implemented (in text, it is difficult to sort those things out).

>From what I have read, the open reactance should be at least 4 to 5 times

>So did I do good? Am I way off?
>How can I tell if/when core saturation will be a problem?

The ratio is as good as any. More important is how much power the
BalUn can withstand. Your last question gets into the common
misconception of "core saturation" which is typically a consideration
for the winding linked magnetics not found in this application. BalUns
are not classical power transformers that are so common to 60Hz AC.

The choke BalUn (which is what you are building) employs the lossy
resistance of Ferrite to establish the isolation you want in a BalUn.
There may be some reactance achieved along the way, but it is not
usually a design goal and these class of Ferrites would be a poor
choice in achieving that. If you note that your data describes a
very, very broad curve; it demonstrates a very poor Q which is its
principle attraction (broadbandedness).

As a simple test, pass one very short wire through one bead and
measure its Z (give us a complete description of resistance AND

reactance) over frequency. This will confirm what type material you are using and will remove unnecessary complexity. Type 43 should show a frequency peak roughly ten times above your current data's frequency peak.

This may have been obscure. The peak of isolation (as revealed in
common mode resistance) should occur in the low VHF region, not the
low HF.

Hi all,

I like to inform you that Martein Bakker, PA3AKE, has updated his web page reporting his measurement on the H-Mode Mixer. The update is relative to measurement done on the I7SWX 2T H-Mode Mixer using the FSA3157 and the original 2T version with Pericom PI5C3125 fast bus switch.

A major comment reported by Martein on the 2T HMM version with FSA3157 is:

"2 transformer version is an interesting branch in H-Mode mixer development. Most impressive is the spur reduction possible with home made transformers with this configuration in combination with the FSA3157 switches."

PA3AKE web page is: http://www.xs4all.nl/~martein/pa3ake/hmode/

Below is reported the Contents list of all measurements done and comments reported by Martein. I am sure all those that have visited and will visit his page will find one of the most complete reports done on the important H-Mode Mixer developed by Colin Horrabine, G3SBI.

73 and enjoy the reading

Anybody happen to have the details of the dipper coils for the MFJ-259B Antenna Analyzer? Mine have become lost in a garage/workshop cleanout that went awry.

Need number of turns, coil diameter, coil length if possible. Think I can remember the rest of the details well enough to rebuild them.

Thanks for your help

> regulator power supplies.

Well, maybe "low inductance" by 1960's standards. A computer power supply would have to filter 60Hz, or maybe 400Hz ripple then. Yes, there were switching supplies back in the 60's/70's too, but then switching frequencies were much much lower (think about it: they used 2N3055's or their predecessors, transistors that take a millenium to turn off!) than typical switching supplies today.

Modern low-ESR low-inductance caps are undoubtedly superior if you're designing 150kHz switching supplies today. Heck, many of the modern regulator chips will only be stable if they are operated into capacitors that have an ESR above a minimum and below a maximum number. There's a reason why there are 87 different 220uF 6.3V capacitors in the Digikey catalog :-).

Clearly for their purposes, surplus 2N3055's and old big-can "computer grade capacitors" can be put to very good use in many ham power supplies. Make sure you get some LM723's too, a very versatile part that modern parts (each good in their own narrow niche) have not completely replaced yet!

(I did lament here on Usenet when the CA3046 was discontinued a year or two ago... a shame! But the LM723 will outlive it!)

Tim.

As you have a vector impedance meter have you measured the common mode (blocking) impedance? From the description your balun is a voltage balun that are notorious for having poor common mode impedances.

Apart from aviation, the last time the last time I heard someone using
400 Hz for powering computers was in the early 1960's with a 50/400 Hz
motor/generator in the basement, feeding the anode supply of some tube
computers :-), in order to reduce the transformer and filter capacity
size.

Outside TV EHT generators, primary switching power supplies were rare
in those days, simply because bipolars could not handle the rectified
mains voltage in those days, not at least with any significant
current, so linear power supplies was the norm in those days.

>Clearly for their purposes, surplus 2N3055's and old big-can "computer

My guess is that amateur radio is the last application in which linear
power supplies are used, since it is much easier to make a low noise
linear power supply than a switcher.

Yes, the balun is a 4:1 voltage type. I have not measured the common mode inductance yet. But in this case, the application is for a Carolina Windom which requires common mode current to make part of the feedline act as a radiator.

The feedline will be choked with a 1:1 current balun at the proper distance. That is next on the list to be built.

Okay, then in that case be sure to check the common mode impedance on
your current balun. Many are less than 1K and, for good operation
you'll need more than that. The higher the better.

I did find out that part of my test setup was flawed.
My adapter from the VIM probe to the coil did very naughty things.
The new setup completely isolates the balun from any surrounding
influences and stray L/C is minimized.

Testing the bead material properties.
The beads I am using are supposed to be Type 43, DigiKey #240-2119-ND
aka Steward 28B1250-000. They are .875" high, 1.25" OD and .75" ID.

Using piece of wire 3" long bent into a U shape. Measurements are
Magnitude and Angle of the vector.

Freq.
(MHz) Bare Wire Single Bead Two Beads
.5 .58 @ 29.0 4.62 @ 68.2 9.0 @ 70.3
1 .74 @ 46.0 8.09 @ 70.2 15.8 @ 71.0
2 1.15 @ 62.1 14.36 @ 70.2 28.0 @ 70.4
4 2.08 @ 74.7 25.30 @ 67.0 49.6 @ 66.3
8 4.04 @ 81.8 42.00 @ 61.6 81.7 @ 60.3
16 8.01 @ 85.5 68.50 @ 56.4 132.7 @ 54.0
32 15.93 @ 87.3 105.40 @ 46.9 204.0 @ 42.3
64 31.80 @ 88.4 145.10 @ 37.4 279.0 @ 27.9
110 56.30 @ 89.0 181.00 @ 30.6 333.0 @ 13.2

Remeasuring the Balun.
With the new setup, there is not a big difference in the terminated
measurements, but the peak in the open impedance of the primary winding
went from ~7 Mhz up to 11.4 Mhz.

Freq.
(MHz) Open Inductance 200 Ohm Termination
.5 275 @ 74 49.6 @ 9.2
1 491 @ 72 51.1 @ 5.4

Large electrolytics labeled "computer grade" were quite common in low-
voltage supplies required for digital electronics from the early 1960s
and
into the next three decades. Once the TTL family of digital ICs "took
off" all digital electronics seemed to require 5 VDC supplies. :-)

Since the early TTLs were - relatively speaking - power-hungry, the
supply current had to be much higher than for old tube architecture
equipment. With that was the requirement for filtering the raw DC
from (nearly-always) full-wave rectification resulting in 120 Hz
ripple.
The end result was a market need for higher-Farad electrolytics.
Low-ESR in those large-capacity electrolytics was, in my opinion,
less of a problem for switchers than it was to cut down on the
internal
heat dissipated by the ripple current in that ESR.

I agree with that, Paul. The switch-mode supplies did not increase in either market quantity or acceptance in OEM equipment until the late 1970s. One frequently-overlooked example is the small supply (a switcher) used in the Apple][personal computer. Well over a quarter million made and sold to power a small computer using (then) legacy TTL devices. While some CP/M-based PCs existed using switching supplies, other PC makers saw the advantage and started using switchers also, even the "IBM" that became the norm for PCs after 1980. While most switching supplies were still radiating RFI into
the late 1990s, that did not trouble PCs operation. After multi-millions
of PCs have been made with switchers for power supplies in over two decades, it would seem (to many) that "switchers have always been used." :-)

Much SIMPLER. :-) Today a typical under-1-Ampere supply consists of an AC transformer, bridge rectifier, one filter capacitor, and one three-
terminal regulator. Positive or negative polarity, no real change in components. Guaranteed voltage regulation and the legacy three-terminal regulator ("7805" for +5 VDC output) has over-current shut-down. Spec sheets on three-terminal regulators include maximum internal noise generation (very low) which few bother to notice. :-)

Excess power dissipation in a linear regulator? Actually not much. A typical +5 VDC supply for 0.5 A uses a typical 8.5 V average raw DC input and a three-terminal regulator drops about 3.5 V average for a 1.75 W average loss converted to heat. The TO-220 cases of three-terminal regulators are built to handle that (and a bit more) if mounted to a "heat sink" of copper-one-side PCB. Three-terminal regulators are entering their fourth decade of existance and couldn't be more convenient to use for a defined, regulated output voltage.

Teh,

After reading you previous response as the your application I have some real doubts as to the efficiency and power handling capability of you unit.

I suggest you may find some very useful information at:

http://audiosystemsgroup.com/RFI-Ham.pdf

The section on baluns begins on page 24, however, my power concern is addressed on page 26.

I think you find that information valuable.

73,
Danny, K6MHE

MG Sets (400 Hz) powered many mainframe and midrange systems well through the late 1970s; CDC's small graphics system called 'GRID' used a mini (2500KVA) 400 Hz MG set and it was built with TTL and DTL, and the entire 1604, 3000, 6000, 7000 and most Cybers used large MG sets. The 160/160A/ 8090 series could be equipped with 400 Hz (MG driven) supplies or 60 Hz switchers (circa 1959-1966).

Michael

1433. Tektronix 7603 scope behavior when readout board is missing

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-06 03:14:57 UTC
From: msg <msg@_cybertheque.org_>
Message-ID: <133qi16a39ohn43@corp.supernews.com>
Source record: 7522
Cross-posted to: comp.arch.embedded,rec.radio.amateur.homebrew,sci.electronics.repair

Greetings:

I just acquired a Tek 7603 scope with 7A18 dual-trace vert. and 7B53A timebase plugins but upon internal inspection and cleaning discovered that the readout board (when facing the front of the instrument it is found on the upper right side midway along the length) is missing, as are all interconnecting cables it uses.

The display is very corrupted: odd blanking and sawtooth displays appear with no vertical input and horizontal sweep width changes with timebase selection in a drastic way. A vertical input signal modulates the strange displays in a fashion that suggests the vertical section is functional and the vertical position controls do work.

The plugins are supposed to be in operating condition.

The internal logic timeshares the display between readout and waveforms and is rather complex and implemented in Tek custom hybrid ICs and a mix of TTL and CMOS. I would really appreciate a report of the behavior on a working 7600 series scope when the readout board is disconnected; the service manual describes various voltage measurements with the board removed so it is permissible to do so and power the instrument (but no mention is made of the scope's behavior with the board removed).

Many thanks to anyone willing to do this.

Regards,

Michael

Hi,

I've been recently going through a similar process. Designing a UHF VCO for a hobby project, mainly as a self-education project. As in, rather than buying the thing from Minicircuits or whoever and be done, learn how to design and build one myself, so that I never have to buy them. And to get them much cheaper... a few cents a piece, as long as you don't mind the effort.

Anyway, when I couldn't get it quite right for a while, with tuning range, harmonics, output power, etc, here's what I did: Build a prototype, measure the frequency and output level. Try with a few different tuning cap values in place where the varicap would be. Got a proper RF simulation software*. Spice is probably not the best tool for that. See if simulated oscillator frequencies match what was really measured. I found out that after I included all parasitics properly (eg. 0805 capacitor might have about 2nH inductance), and also the PCB interconnections and the right transistor model, I get almost exact match. A 1.4GHz frequency in the simulation, within a few % off the real measured frequency. So now I know I got the simulation right, and I can go ahead and experiment with different varicap types, circuit topologies, etc... and I only get to the next PCB+soldering iron exersize when the simulated performance is what I need. Saves time.

* I realise that getting 'proper' RF simulation software can be tricky/ expensive...

For many years I worked for other people on the daily grind. 9 - 5 and much
longer
hours for what now seems like very poor pay.
I suppose looking back on it now, I didn't really know how trapped I
was until I discovered an easy way to make money using Ebay and the
Internet.
Since then I haven't looked back and have been making money
consistently. For a long time now, I have been developing a number of
interesting methods that can realize lots of money both on and off
ebay. I am now offering you the opportunity to do the same.
Each method is completely legal. There are no pyramid schemes, MLM
schemes, affiliate programs, investment schemes or adults only
business. This is not dropshipping, misspelled ebay adverts or
selling
for other people.
I am offering you the chance to make enormous amounts of money both
on
and off ebay!
Are you tired of 'Get Rich Schemes'? Well you can relax and purchase
from someone with an excellent reputation.
I have been making a living online now for many years and have a
number of different ebay ID's from which I sell. I do a lot of
different things both on and off ebay and make a profit from all of
them. I have found enormous success in four key areas that I am now
offering to you.
These methods are not diet pills, pyramid schemes, affiliate
marketing, or running a website, just four incredible opportunities
for you to make enormous amounts of money.

Post what options were sold as part of this scope. Some were sold
without readouts, the fact there are no connectors indicates that
possibly the readout option was deleted.

IMHO, (and this is just a WAG) the problem you are reporting is not
related to the readout...

Digging through Internet archives this morning I noticed a few posts
from folks seeking the readout board for 760x scopes with a mention
that 'Option 01' was a cost-reduced version sans this board so evidently
the scope should work without it (if properly optioned?). I was not
sure if any cable modifications would be needed if the board were
removed from a scope not-so-optioned.

And indeed I now discover an "Option 1" label on the bottom of the
left bay so this scope never had the board.

Its problems are elsewhere.

Thanks,

Michael

<snippety>

There is a Tektronix group on Yahoo groups that is loaded with very
experienced 'Tekkies.' You would do well to take your query there.

Off the top of my head, I would say two things.

(1) Get the service manuals for your 'scope frame, AND both plug-
ins. It will be nearly impossible to troubleshoot or service without
them.

(2) Check your power supply section for bad filter caps, correct
voltages, noise, etc. Ironically enough, you will likely need a known-
working 'scope to fix this one.

Happy tweaking.

Yep!!! My MFJ-259B has lots of guts too.
The dipper coils are used to make the Analyzer operate like a grid dip meter.
Extremely useful for tuning traps, tanks, etc. They are an accessory to the
Analyzer; I think the part number for them is MFJ-66.
There are two coils in the set, one for 1.8 MHz to 50 MHz, the other covers 20
MHz to 170 MHz.

Cheers!

Mouser has a respectable line of aluminum and steel chassis in their
catalog. The selection, today, is not what it was back in the 50's or
60's, but you can find what will work. Prices are a lot higher, too,
especially for cabinet-type metalwork! I just pulled the '57 issue you
spoke of. No problem with the chassis but the cabinet no longer exists
from Bud, et al, much less Hammond. There is a fellow who ads in several
pubs that makes aluminum chassis and cabinets. He's resonable and I'm
sure he can gin up what you need. He's located in the Mid-Atlantic area
and I saw him, last weekend, at a local hamfest.

> Any suggestions?

Aluminum chassis are available ($10-$30 range depending on size) from
www.digikey.com, www.mouser.com, www.tubesandmore.com, etc.

Kitchen pans/baking trays can be surprisingly effective as well for a
lot less money.

A good hardware/welding store will have aluminum sheet and extrusions.
Home Depot etc. really suck in this area.

As far as full metal cabinets go, the above-named distributors will
have them by Hammond, Bud, etc., but you'll be shocked at the prices.
Recycled enclosures from other projects or picked up at hamfests are
quite affordable though.

McMaster-Carr has a lot of stuff, not discount prices, but excellent
selection and they ship to me overnight via UPS ground. They also have
a lot of plastics, tubes, etc. http://www.mcmaster-carr.com/

Also, consider having enclosures made at a local sheet metal shop
(heating, cooling, ventilating); I've had them done for _very_
little money out of galvanized, and you can solder to them.

The problem was a defective C811 (14000 uf / 25v), the -18V filter
capacitor for the -15V supply.

Scope works well now.

It is the working grade. Rated duty cycle.
There are commercial - 8 hours in 24
industrial - 12 hours in 24
computer or telephone grade 24 hours in 24.
The MTBF data is determined using the appropriate duty cycle.
See ITT Handbook for more info.

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html situated in the Mid North Coast of
NSW

Australia at Coffs Harbour are looking forward to making Local or DX IRLP
contacts on Fridays 0315 - 0345 UTC.

Contacts will be on IRLP node 6625 via local repeater VK2RDO on 146.650Mhz.

The young people in the club have been experimenting with building simple FM
radio recievers, and
have been contemplating the design of plasma balls using ordinary light
globes and car spark coils.

Contacts with interested parties or similar school electronic/radio groups
would be great but unfortunately
the club only has limited time during the local lunchtime period.

Also the Bishop Druit College French and German Language classes are
interested in contacts Monday to Friday 0315 - 0345 UTC.

If interested and can help arrange a contact please email:

Gary VK2ZKT gryan@bdc.nsw.edu.au

or

Peter VK2EVB vk2evb@wia.org.au

Hello,

The aluminium that retail chassis are made from is a joke. Get some
1.6mm 5052-H14 from a local aluminium shop, a $30 brake and away you go.
You can make 5-7 for the cost of one retail ;-)

Cheers,

Sounds good to my repair eperience. Due to own experience bad/dried
filter caps in the LV pwr supply of Tek 76xx is often a problem. I had
more than 50 of these for repair, and most of these due to cap
problems.

Good luck with your fresh repaired scope, it is a nice instrument
(with and without readout option).

hth,
Andreas

Ross,

Commercial outlets like Digi-Key, Mouser, Newark-Inone,
and Allied Electronics carry a wide array of aluminum
and steel enclosures. They're not cheap these days, but
if you need one, you need one. Also keep an eye on eBay
for chassis and enclosures. I've snagged some good ones
there at very reasonable prices. And, of course, visit
every local hamfest and SK estate sale. There are still
bargains to be had that way. I picked up a nice cabinet
at an estate sale just the other day which I intend to
build a power supply in. It is about 6" tall, 8" deep,
and 12" wide, and it's new in the original box. The was
only $6.00! I buy cabinets and chassis whenever and
wherever I find them, and then worry about what I can
use them for.

The projects you're contemplating sound like something
I'd build! (see my web site, http://www.qsl.net/k5dh)

73 and good luck!
Dean K5DH

A factor of 5:1 in price?

My local sources charge about $5 per sq ft for 0.040" 5052-H14
aluminum.

A 17x10x3 chassis needs about 3 square feet.

That's $15 for materials, not counting wastage because the local
source only sells it in 4x8 feet sheets :-). I compare that to $25 for
a Hammond chassis of the same size already made and spot welded, and I
don't see as big (5:1 or 7:1) of a disparity in prices as you do.

Now, I can get little (square foot or two) aluminum cutoffs at some
scrap piles for a lot cheaper, and those work great for tiny little
subchassis or miniboxes, even better to do it myself there because
dimensions are often critical.

Maybe I'm buying really super expensive aluminum and you know where to
get it for $1 or so a square foot. If so, tell me where!

Tim.

For many years I worked for other people on the daily grind. 9 - 5 and much
longer
hours for what now seems like very poor pay.
I suppose looking back on it now, I didn't really know how trapped I
was until I discovered an easy way to make money using Ebay and the
Internet.
Since then I haven't looked back and have been making money
consistently. For a long time now, I have been developing a number of
interesting methods that can realize lots of money both on and off
ebay. I am now offering you the opportunity to do the same.
Each method is completely legal. There are no pyramid schemes, MLM
schemes, affiliate programs, investment schemes or adults only
business. This is not dropshipping, misspelled ebay adverts or
selling
for other people.
I am offering you the chance to make enormous amounts of money both
on
and off ebay!
Are you tired of 'Get Rich Schemes'? Well you can relax and purchase
from someone with an excellent reputation.
I have been making a living online now for many years and have a
number of different ebay ID's from which I sell. I do a lot of
different things both on and off ebay and make a profit from all of
them. I have found enormous success in four key areas that I am now
offering to you.
These methods are not diet pills, pyramid schemes, affiliate
marketing, or running a website, just four incredible opportunities
for you to make enormous amounts of money.
'I don't just sell these methods, I guarantee them. And if you don't
succeed then I'll give you double your money back!'
WHAT I OFFER
Four great systems for generating fast cash

Assuming that these dipper coils are connected to a PL259 plug for
connecting to the MFJ259B 's SO239 socket , it should not be too
difficult to homebrew the coils ....I'll have a go at that.

That "Novice Special" is a good article. Reminds me of my first transmitter, a 6C4 driving a 2E26. Got me a special, commemorative QSL from the FCC. Apparently, I was 599 on 7446!

You are in luck! LMB is still around and still makes that very cabinet:
http://www.lmbheeger.com/products.asp?catid=18

I also like Mouser. Order something from them and you'll get catalogs for a long time. Lots of parts..
http://www.mouser.com/

Also, MPJA has interesting items from time to time.

Over the years I bought some large size sheets double sided PCB material
at flea markets.
Provided there are no heavy transformers ,both chassis and enclosure can
be made of the material.
Under chassis screened compartments can be easily included.

Yeppers!!! I surely do remember the PRM-10. Almost bought one at a hamfest a
few years ago, but it looked like it had been through just about every battle in

WWII, Vietnam and Desert Storm.

They were good instruments; I used them while I was in the Navy as an ET during the 60s. I found them to be quite useful while overhauling old comm equipment while I was aboard the USS Vulcan (AR-5) during that period. Got a tremendous amount of experience on that ship.

Cheers!!!!

If you've been around electronics a while, you might remember the
"SeeZak" line of modular chassis sides and tops. LMB-Heeger
carries that same thing now: www.lmbheeger.com

Click on "OmniChassis" on their Products link page.

Chassis sides (sold in pairs) come in 2", 3", or 4" height with
lengths from [height] to 17" in increments of one inch. The
material is aluminum, 0.040" think. Chassis tops and bottoms
come in all dimensions from 4" x 4" to 17" x 17". Top/bottoms
are fastened to side pieces with small sheet metal screws
(holes provided) at one-inch increments. Side piece ends
snap together, final fastening by the screws through top/bottom
panels to the bent-over edges of side pieces.

Top/bottom panels thicknesses are 0.040", 0.050", or 0.063"
depending on their overall dimensions (13" x 13" and bigger
are 0.063" thick). One can use the smaller-length side pieces
to form in-chassis walls for shielding or extra mechanical
support. An advantage in hole drilling of tops/bottoms is that
panels can be mounted on scrap plywood for support (such
as in drill press) or punched via industrial punch presses
(hard to find those presses now).

Not cheap but they don't cost an arm and a leg either.
Another advantage is that making a mistake on hole
locations isn't a scrap-out of a whole chassis or klugey
retrofit...just use another panel or side piece. While the
aluminum alloy is "softer" than 2024, an assembly is as
robust mechanically as any fully-formed chassis bought as
a unit. I find them very useful in making near-production
quality prototypes since they turn out as neat as any
full-chassis version.

Bobs around between $2.75 and $3.15 CAD where I live in a trucking/farming community. No shortage of full-sheet capable aluminium shops. Got 5 within a 20 minute drive.

> That's $15 for materials, not counting wastage because the local

$25 for a 17x10x3 Hammond? You must be in the US. They are $45 here.

So, from my POV, buying retail chassis is just silly.

Cheers,

Gregg

Well, Ross.
The dates of the articles are about the time I got my novice license.
Back then we could go to a sheet metal shop and tell them the size of
the chassis (box to them!) and they would cut it and fold it and spot
weld it. This was using galvanized sheet steel. I supposed aluminum
sheet was available, but cost more. I am sure you could go to a
similar sheet metal shop or heating/cooling shop and have them make a
box for you.

Another possibility is to watch Ebay for something that will work for
you. Although that might take a while.

Good luck.

1469. Roller inductor question

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-09 04:50:06 UTC
From: Joel Kolstad <JKolstad71HatesSpam@Yahoo.Com>
Message-ID: <1342ko16kkk3v9e@corp.supernews.com>
Source record: 7458

I've been thinking of getting some roller inductors to play with next time I visit a hamfest, and it occurred to me that a generic roller inductor doesn't have a linear change in inductance with roller position... does it? E.g., at the half-way point you should get 1/4 the total inductance, right?

Or is the form wound such that the turns are closer together at one end than nothing, thereby linearizing the inductace vs. roller position to some degree?

Thanks,
---Joel Kolstad

P.S. -- They never made small (say, size of an old Kodak film canister)-sized roller inductors meant for QRP work, did they? Most seem to be sized for hundreds if not thousands of watts.

>
> Tim.

Our economics are like our politics - inexplicably stupid *rolls eyes*

It's cheaper for me to buy and import Hammond from Parts Express than it
is to buy from a dealer an hour away. Dumbfounds me too.

What IS a super deal are Chinese made rack mount cabs w/panel from RP
Electronics in Burnaby, BC.... thicker aluminium than the Hammond and $57
compared to ~$180 for the Hammond. I kicked one around (literally),
quality is comparable.

Cheers!

Gregg

Right, unless it's wound linear inductance. Those can be found as surplus
from test equipment. The ones found surplus in receiver's are usually
linear frequency, rather than linear inductance. They are visibly quite
different.

> P.S. -- They never made small (say, size of an old Kodak film
> canister)-sized roller inductors meant for QRP work, did they? Most

They exist. I could barely give a dual one away on Ebay last year. Dual
QRP roller too! Finally someone grabbed it for $5.

Cheers,

Gregg

1472. High School Radio Club looking for IRLP School contacts in Asia

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html
situated at Coffs Harbour NSW Australia
is hoping to make IRLP contacts on Fridays
0315 - 0345 UTC. (Lunchbreak)

Perhaps areas with similar time zones in Asia,
like Malaysia, Hongkong, Vietnam, China,
Japan, Korea, and parts of Russia are of
interest to the students.

Contacts will be on IRLP node 6625.

Contacts with similar school electronic/radio
groups are of special interest.

If interested please email:
Gary VK2ZKT gryan@bdc.nsw.edu.au
or
Peter VK2EVB vk2evb@wia.org.au

>doesn't have a linear change in inductance with roller position... does it?
>E.g., at the half-way point you should get 1/4 the total inductance, right?

With a roller inductor the ratio of length to diameter is not
constant as the tapping point changes so the inductance is not
simply proportional to N^2. Using the standard handbook formula
(Nagaoka's), I get the inductance at the centre to be just under
half (44%) of that across the whole coil. Doubtless though, toward
the end, this formula becomes rather inaccurate.

Cheers - Joe G3LLV

In general, a linearly-wound inductor will follow the cylindrical
inductor equations. There might be some changes from that
from the influence of the "left-over" (unconnected) windings,
including fringing capacitance to ground.

In the few cases of linear-frequency-tuning, notably in Collins
PTO units and the "rack" assemblies in the R-390 family, the
windings were deliberately spaced to handle the powdered-
iron core position effect on inductance. I suspect that Collins
did a lot of cut-and-try to achieve the correct spacing changes
on those; very little quantitative information on it is available
in text or on the web. :-)

I'm not sure I understand the difference. I'd think you'd want a
chirp to be phase-continuous, because that means that the waveform
doesn't experience any abrupt discontinuities as its frequency is
modified. What exactly does "phase coherence" refer to (if not the
ability to maintain a fixed phase relationship between two or more
different sources)?

Subject says it all.. has anyone created a PCB footprint in EAGLE for the Mini-Circuits GALI MMICs or any other parts that use the same package style? This is the DF782 case style (http://www.minicircuits.com/case_styles/DF782.pdf), PCB layout http://www.minicircuits.com/pcb/98-pl019.pdf .

If someone is willing to share a library file that includes this footprint, I'd appreciate a copy. The minicircuits.lbr file at www.cadsoft.de doesn't include it.

Tnx! -- john, KE5FX

VHF DX seems hot. I've been logging FM broadcast stations from Michigan
down to Missouri from near Vancouver, BC off and on since February!

Cheers,

Gregg

Note that the RF section slugs do not follow a linear-with-frequency position; the while the shafts move linearly with frequency, the cams introduce a necessary nonlinearity in the slug's linear position that is necessary in the overall design.

And to get back to the OP's case of antenna tuners/pi matching networks etc. it is not necessarily desirable to have the tuner's (or pi-network's) inductances and capacitances vary linearly with knob position. You actually want the curve of knob position vs value to be logarithmic (look at the Hammarlund and Millen and National ads from the 40's through the 60's to see all the various nonlinear variable capacitor curves that are desirable in various uses) to make tuning less critical on the high bands and more useful on the low bands.

Folks who grew up with pocket calculators and digital multimeters might assume that everything should be linear. Those of us who learned with slide rules know that in the real world, logarithmic is more useful!

Tim.

I was referring specifically to the "PTO" (Permeability Tuned
Oscillator) that first saw wide use in Collins radios. That
tuning *IS* linear in frequency versus knob position. If you've
ever opened one to examine it, you will understand. Most of
the Collins PTOs also had a minor correction mechanism for
that tuning but, in essence, the winding pitch of the tuning
inductor varied according to some internal Collins manufacturing
rule.

I've also had my hands on many an R-391 and understand that
mighty mechanical monster still - even though it was four decades
ago - and would say that trying to find a correct winding pitch for
all those (broadband relative to tuning rate) inductors would have
made the production cost way too high. It wouldn't be
important because the actual Q of those variable inductors made
the front-end resonators broad enough so that "crude" cam
adjustments were okay for practical purposes.

I began actually handling of lots of high-power HF transmitters
in the early 1950s, notably the ones made by the Lewyt Vacuum

Cleaner Company! :-) No real relationship of capacitance or
inductance curves to tuning...wayyyy too many variables involved
in antennas-lines-etc. to pin down any "necessary curves."

> Folks who grew up with pocket calculators and digital multimeters
> might assume that everything should be linear. Those of us who learned
> with slide rules know that in the real world, logarithmic is more
> useful!

High disagreement there. Having learned and owned a slide
rule in high school of the late 1940s (and understood logs
and elementary transcendentals), I switched to sceientific
calculators (forever, I think) as soon as they were on the
market, never looked back. I severely dislike non-linear tuning
as it has NO physical-sensor-body correlation with signal
bandwidths or carrier positions.

I see Joel's roller inductor question connected with my
experience with Press-Wireless 15 KW transmitters and
their dual copper tubing final amplifier inductors. QSYs
on those PW-15s required unwrenching the shorting links
then rearranging the shorting links, remounting them,
again with a wrench. Having helped make better sets of
shorting links and doing some intial tuning (to set preset
tables for number of links), the unshorted links were
generally in the inductance values predictable by old-style
equations of inductors. There was some effect of the
shorted turns which was arrived at during the preset tune-
up tests. Those were feeding rhombics directly and there
were no fancy tuning-matching circuits involved in the
typical 4 to 18 MHz RF region.

An automatic tuner I worked on a long time ago had motor-driven
variable inductors only slightly larger than that. I guess it handled
about 200 watts. The design wasn't roller, but slider; it tuned very
fast for a mechanical system. There were one or two motor-driven
vacuum variables in there too.

Cheers,
Tom

1484. YOU WON'T BELIEVE THIS, IT'S CRAZY BUT IT WORKS

THIS REALLY CAN MAKE YOU EASY MONEY! IT WORKS!
BUT YOU HAVE TO FOLLOW IT CAREFULLY FOR IT TO WORK!
A little while back, I was looking on the web for easy ways to make money and I kept thinking that all of the ways I was reading would never work and were just scams, but not this one! The article that I had found said that I could make thousands of dollars easily in a matter of weeks with only an initial small payment of $6.00. I thought, "Yeah, right, this must be a scam like most of the rest", but
like most of us, I was curious, so I kept reading. Anyway, it said that if I sent $1.00 to each of the 6 names and addresses listed at the bottom of the article that I would make great money but only if I followed the following steps. After sending the $1.00 to each person you were then instructed to rewrite the list by taking the 1st person off of the list then moving the 2nd person to the 1st spot, and the 3rd person to the 2nd spot, etc, etc. Finally you should be left with
the number 6 spot empty and this is where you place your name and address. After reconfiguring the list you then must post it on about 200 newsgroups (doesn't matter but the more places you post the more money you make!). There are thousands and thousands of newsgroups from around the world so this task is easy and that was it when I was done! No catch. So after thinking it over, I thought about trying it. I figured, what have I got to lose except 6 stamps and $6.00, right? Like most of us I was a little skeptical because it seemed so easy and I was a little worried about the legal aspects of it all. So
I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! (U.S. Postal and Lottery Laws Title 18, Section 1302 and 1341 and Code of Federal Regulations, Volume 16, Sections 255 and 436) After reviewing the pros and cons of
the investment I decided to carry out with it. I invested the measly $6.00 and guess what? Within 7 days, I started getting money in the mail!! I was very shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By
the end of the second week I had made a total of over $1,000.00! In the third week I had over $6,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $21,000.00 and
it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps. Now let me explain to you how this works and most importantly, why it works. Also, make sure you print a copy of this

article NOW, so you can get the information off of it as you need it.
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US
$1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next,
place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase (PLEASE PUT ME ON YOUR MAILING LIST), your name and address, and a $1.00 bill. What you are doing with this letter is creating a service. THIS IS ABSOLUTELY LEGAL!
Now mail the 6 envelopes to the following addresses:
1. LORRAINE HUTCHINSON (P.O. BOX 23951 LONDON ENGLAND E12 5YP)
2. GEAN SAPP (1768 OLD HICKORY STREET, DECATUR, GA 30032)
3. TAMEKA HILL (P.O. BOX 188 JAMESVILLE, NC 27846)
4. DAN BELL (1519 CAMERON LANDING DRIVE, STOCKBRIDGE, GA 30281)
5. ERIC PORAT (2345 EAST 64 STREET, BROOKLYN, NY 11234)
6. MATT SANTIAMAGRO (1120 SUNSET AVE, KELLEY, IA 50134)
STEP 2: After you have mailed out your letters creating a service and making this legal, take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR NAME & ADDRESS as number 6 on the list.
STEP 3: Change anything you need to in this article, but try to keep this article as close to original as possible. Now, post your amended
article to at least 200 newsgroups. (I believe there are close to 24,000 groups in USA alone). All you need is 200, but remember, the more you post- the more money you make!
DIRECTIONS --HOW TO POST TO NEWSGROUPS
Step a) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computers memory.
Step b) Open a blank "notepad" file under accessories in windows and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step c) Save your new notepad file as a .txt file. If you want to do your postings in different sittings, you'll always have this file to go back to.
Step d) Use the Internet to search for various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step e) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that
everyone sees as they scroll through the list of postings in a particular group, click the post message button. After you have

completed these steps you are done with your first posting.
Congratulations! You are that much closer to easy money! THAT'S IT!
All you have to do is jump to different newsgroups and post away,
after you get the hang of it, it will take about 30 seconds for each
newsgroup! That's it! You will begin receiving money from around the
world within days! You may eventually want to rent a P.O.Box due to
the large amount of mail you will receive. If you wish to stay
anonymous, you can invent a name to use, as long as the postman will
deliver it. *JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT AND
REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200*
WHY it works: Out of 200 postings, say I receive only 5 replies (a
very low example). So then I made $5.00 with my name at #6 on the
letter. Now, each of the 5 persons who just sent me $1.00 make the
MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me, now
those 25 each make 200 MINIMUM posts with my name at #4 and only 5
replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and
only receive 5 replies each, I will make an additional $626.00! OK,
now here is the fun part, each of those 625 persons post a MINIMUM
200
letters with my name at #2 and they each only receive 5 replies, that
just made me $3,125.00! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons
per 200 newsgroups react I will receive $15,625,00! With an original
investment of only $6.00! AMAZING! When your name is no longer on the
list, you just take the latest posting in the newsgroups, and send
out
another $6.00 to names on the list, putting your name at number 6
again. And start posting again. The thing to remember is, do you
realize that thousands of people all over the world are joining the
internet and reading these articles everyday. Remember play FAIRLY
and
HONESTLY and this will work.

Interesting puzzler and as I've a number of these Roller Coasters built in
to various old military radios, I measured one.
This particular inductor is the "Aerial Tuning" inductor fitted inside the
casing of a 1946 vintage, UK "Wireless set number 62", a TR-RX running about
2 to 8MHz. The inductor is a Paxolin former 6.5" long by 2" diameter, wound
with what looks like 1mm dia' Silver wire. There's exactly 100 turns wound
evenly along it's length and the radio front panel has a little window
showing a "00" to "99" turns counter, operated by the tuning knob and a neat
Geneva mechanism. For measurement purposes, it's ideal.

TURNS. INDUCTANCE.
100 132uH
90 120uH
80 103uH
70 89uH
60 73uH
50 58uH
40 43uH
30 29uH
20 15.8uH
10 4.7uH

0 0.12uH

Values look not too non-linear and probably follow the solenoid formulas but
I can't be arsed doing the calcs :).

Using Mathcad, the coil mentioned in this thread has the following properties:

1) From 0 to 20 turns the inductance is 0.038 times n squared microhrenies (square law).

2) From 20 to 100 turns the inductance is (1.49 n - 16) microhenries (very linear).

For the first 20 turns the coil has the square law property because all of the turns are tightly coupled to each other. This is not the case for the other 80 turns of a long solenoid.

A PDF of the Mathcad calculation and graph are available by email from W0IYH at QRZ.COM).

1489. How to reduce two-way radio's power output?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-12 22:11:26 UTC
From: sd89fd0_7@yahoo.com
Message-ID: <1179007886.815747.161220@h2g2000hsg.googlegroups.com>
Source record: 7478

Nowadays two-way radios are getting more and more powerful, coverage up to 8, 10 12 or more miles. Ironically, it is even harder to buy one with only 2-mile distance.

I want to use a two radio just for short distance, for example, only within 1000 feet. How to modify the circuit (generally speaking) so I can extend the radio's powerful consumption? As I do not need it to communicate for longer distance, I want it to reduce power output, so I can use it for longer time. I know it is difficult to illustrate without a schematics, but just in general terms, what kind of options or in what areas can I do the modification?

One of my applications is to use 2-way radio as baby monitor for longer distance than normal baby monitor does.

The simplest modification is an attenuator pad between In/Out
and the antenna. If you have a "one-piece" FRS HT such as
the little Motorola my wife and I use at home, it is difficult to
wedge one in there. An alternative in that case is to use a
piece of conducting foam (typically for storage of CMOS digital
devices) to sit over the antenna stub. One has to experiment
with the size of the block of plastic foam.

A drawback to using an HT is the power drain on the internal
battery and forcing the PTT button into transmit all the time.
That will eat up battery charges and an external power source
would be needed. However, always on transmit can cause
interference to other users on that FRS channel and is a legal
no-no. It would be better to just get an old 49 MHz baby
monitor and use that directly.

From: Jimmie D <GFENDER@carolina.rr.com>
Message-ID: <464669b3$0$9904$4c368faf@roadrunner.com>
Source record: 7480

I am trying to modify a 1 tube amp for 6 meters using a 6146. I think the amp was origionally used for CB though it does tune up on 10 meters. It worked OK before I removed the input circuit and put in one for 6M. The problem is I cant neutralize the damn thing. It makes a great osc.I was thinking of scraping the tuned input and replacing it with a 200 ohm resistor and a 4:1UNUN. I figure this low of an impedance on the grid would swamp out any feedback that might me causing it to osc. I have about 5 watts PEP of drive.

It could be the screen bypassing--it is critical.

If you can find an old VHF ARRL Handbook
from the sixties you might find some ideas, tips and tricks regarding using
these tubes on VHF. Another problem is unwanted inductive feedback, such
as when the ground ring lugs on some style sockets were used for the
bypass caps... Those rings had enough inductance at VHF to cause unwanted
coupling... Can you neutralize the tube using the conventional neutralizing
stub method??

I think his point is that he's trying to reduce transmitter output power to conserve battery life - of course, an attenuator pad isn't going to accomplish that.

Probably the "easiest" way to accomplish this would be to bypass the final amplifier stage, passing its drive signal directly to the final filter, and from there to the antenna. I would suggest this would be nearly impossible to accomplish without a schematic - and not particularly easy even with it.

I wonder if the best route would be to use a regular baby monitor transmitter - but use a better receiver and/or receiving antenna? Like a decent scanner, possibly with an attic antenna. This method is easy to accomplish even for someone without electronics experience, and unquestionably legal, unlike many other alternatives.

Locate the trace that feeds switched battery voltage to the final transmitting stage. Cut this trace somewhere between the transmit switching circuit and the final amp stage. Insert a few rectifier-type diodes (1N400x) in series across the cut point. Each diode in series will lower the voltage to the final amp stage about .7V or so. For each halving of voltage to the final stage, the output power (and consequently the power load on the battery) will drop by 4:1. All of this assumes that the final amplifier is well-behaved under reduced voltage conditions, which should be true but is not guaranteed.

==========
Assuming that you talk about licence free handheld radios eg FRS in the USA or PMR446 in Europe ,500 milli Watt with a fixed (rubber duck) antenna , you can locate the radio (partly) inside a plastic or carton cylinder which is covered with baking foil (also at one end)

The more the antenna is surrounded by the cylinder ,hence baking foil , the weaker the radiated signal . You then can adjust the cylinder such that a acceptable signal is received at the other location.

A lot of the time both the final and the driver are fed from the same source
so just one diode may have a considerable effect.

Hi all,

It's marked D3827G002 in a 16 pin SOIC and is used in an AMPS RX
chain

Pins identified so far:
PIN 1 Ref / 64 (?)
PIN 2 Ref / 64 (?)
PIN 3 Clock, Data or Strobe
PIN 4 Clock, Data or Strobe
PIN 5 Clock, Data or Strobe
PIN 6 5V
PIN 7 REF IN (15.36MHz)
PIN 8
PIN 9
PIN 10
PIN 11
PIN 12
PIN 13 GND
PIN 14 From Prescaler (?)
PIN 15 Modulus Select out (?)
PIN 16

Date code is around 1990.

Any pointers to a data sheet or a programming guide will be most
welcome.

Thanks,

Mark.

The VHF Hanbook from the 1960's used a 6252 -- I believe that this was also the bube used in various transverters sold by Hallicrafters --- my but no 6146 design -- I still have a bunch of 6360's hanging around from that era.

There is a 6146 transverter design in the 1973 ARRL Handbook -- comprehensive enough to get you done.

A key question I would ask at this point is whether the amp, used originally for CB (27 mHz), was, itself neutralized? Some ham transmitters were not neutralized (eg. Heathkit, Ranger) although they were operated up to 10 meters.

The
> problem is I cant neutralize the damn thing.

When you removed the original input circuit, what, exactly, did you replace it with?

I have found that neutralization of grounded-cathode amplifiers (i.e. high gain) can be a major pain.

It makes a great osc.I was
> thinking of scraping the tuned input and replacing it with a 200 ohm
> resistor and a 4:1UNUN. I figure this low of an impedance on the grid would
> swamp out any feedback that might me causing it to osc.

Nah, I gonna bet that ain't gonna work.

I have about 5 watts
> PEP of drive.

FWIW:
My approach to this would be to build something grounded-grid and that means any grid tube where you can get all the grids to (real) ground. You _might_ get 6AG7s or 6CL6s (two might be enough) in parallel and any decent input matching network might do the job for you and get about one "S-unit" of power gain. Tube efficiency will be a little lower at 50 mHz than 27-28 mhz but not that much.

One of the guys said that screen grid bypassing is critical and I can attest to that, too. Some of the published material even gives separate neutralization circuits for just the screen grid circuit. Very big pain in the neck if you have to do this by trial and error.

Good luck!

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 20th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

1504. Re: Homebrew Keyer

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-15 00:50:30 UTC
From: xpyttl <xpyttl_NOSPAM@earthling.net>
Message-ID: <by72i.35$8a.10@newsfe03.lga>
Source record: 7493

Nowadays, most keyers are nothing more than a micrcontroller, usually a PIC, a battery, a couple of jacks, and some sort of interface, usually a pushbutton. There must be a hundred designs out there, but they all boil down to the same thing. It used to be that the PIC was relatively expensive ($6 or $7) but nowadays, a PIC with more than enough juice for non-memory keyer is $1.01 at Newark. For a memory keyer, you might have to get close to $2. Still way less than the shipping.

A quick google reveals
http://www.qsl.net/dl4yhf/pic_key.html
http://www.qrpis.org/~k3ng/pic/pic_keyer_2.html
http://www.vk1od.net/pik/pik.htm

Far Circuits has a PC board, K1EL sells programmed chips. Google is your friend!

Unless the OP intends to use it for covert evesdropping, hence the plan to
make the battery last longer. 1000 feet is a long way for a baby monitor to
be needed that would be on the next block in most cities.

Asking in an amatuer radio newsgroup (where the goal is often increasing the
range not decreasing it) might not be the best source of info.
thanks, John.

The 6BY6 was intended as a sync separator, and to run with 10V on the plate
at that voltage. My bet is the 6BE6 would be the better tube to use unless
your PD is running at reduced plate voltage.

Can the 6BY6 be used as a converter? The whole thing about the 6BE6 is
that changes in control grid voltage don't affect the cathode current much.
If you're doing the self-excited oscillator trick, I think you need the
6BE6.

The 6BE6 has a transconductance, as an oscillator, of 7250 umhos while the 6BY6 has a transconductance of 1900 umhos, as a Class A amplifier.

Different critters designed for different purposes. Each will work in the other's circuit, but at reduced performance.

You can compare their specifications here:
<http://www.pmillett.com/tubedata/HB-3/Receiving_Tubes_Part_1/6BE6.PDF>

For use in a product detector, is there an obvious "better choice"
between the 6BE6 and the 6BY6?

The 6BE6 seems more common and looks like it'd be better for use with
AGC applied, but that's not how my product detector works, so I don't
know if there's something else which is a determining factor.

The 6BY6 seems to have originally been intended as a sync separator
for TV use.

Tim.

A diode ring mixer from Mini-Circuits?

Seriously, in the later publications that I have the move had started to
balanced mixers -- I would investigate using a twin triode, or get one
of those evil dual-plate steered beam devices (apparently they're
susceptible to stray magnetic fields).

In my case there's no desire for using the tube as an oscillator.

I was just doing a survey of my radios yesterday and the number of
6BE6's stuck in sockets labeled 6BY6 was astonishing :-).

Some discussions in the ham literature indicate that the 6BY6 is less
prone to overload.

Tim.

Heriberto

Try NTEINC.com for a cross reference for the 01-043A transistor.
NTE-349 looks close, and the PDF for the device is available online.

The other part (BY1-1) seems incomplete, is there a Z or T after the
1? I think that was an older Acrian RF transistor. Those look like
REPCO part numbers.

RF Parts shows the BY1-1 in their catalog. Perhaps they might be
able to give you advice regarding the nearest cross reference if you
email them.

There are a number of things that can be considered when using a tube as a mixer. I always thought the 6BE6 was more prone to microphonics than other tubes. That does not show up in the tube manuals.

It is certainly possible that the 6BY6 may handle higher signal levels as a mixer, even though not designed as one. Probably the best test is with a signal generator and in the actual radio.

In the famous HBR receiver design by sk W6TC, the product detector was a
6BE6 in the original circuit, but he later changed it to use the 6BY6
claiming that it gave better performance with less cross modulation and
overload.

The best converter's zaps a single 9 volt battery in 5 minutes, to much
current
You need to use ten - 9V in series.
I have even tried some Mouser VCR display converters they dont have enough
current.

-Joe

Ceramic capacitors with nominal zero temperature coefficient are
usually called C0G nowadays, but sometimes the older term NP0 is
used. There's lots in the Digi-Key catalog (mostly surface mount mind
you...if you are looking for through-hole parts).

Don't forget, a lot of the drift is caused by the inductor in the resonant circuit, and it will have a positive coefficient. Most VFOs have some compensation using a cap with a negative temp coefficient to compensate.

Look for C0G ceramic caps, or silvered-mica caps. They both have low temperature coefficients. C0G are normally maximum 30ppm/C. As Uncle Peter suggested, the inductor will normally have a positive temperature coefficient of inductance -- it's easy to see why for an air-core inductor, since it expands and gets bigger as the temperature increases. You can use C0G for much of the total capacitance, and combine that with a cap with a negative temperature coefficient--if you can find one--to get a very low net temperature coefficient of oscillator frequency. These days, it's fairly common to stabilize a VFO with a phase or frequency locked loop, so it becomes mainly short-term stability that you care about in the oscillator design.

Cheers,
Tom

1536. .5-600 MHz LT5512 impedance matching

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-22 23:25:32 UTC
From: john@feith.com
Message-ID: <1179876332.046883.222850@q66g2000hsg.googlegroups.com>
Source record: 7425
Cross-posted to: sci.electronics.design,rec.radio.amateur.homebrew

I'm working on a homebrewed receiver and am looking at using the
LT5512
as the mixer. I'm not sure of how to arrange an impedance match and
unbalance to balance conversion over a wide range. Perhaps people
can comment on the following so I can see if I'm on the right track.

The LT5512 datasheet says:

Frequency Impedance
10MHz 18.2 + j0.14
240MHz 18.1 + j2.8
450MHz 18.1 + j5.2

One simple approach seems to be:

50 ohm input - ----------- -----------|---------- IN+
) ( ) (___
) ( ) (- ground --- 6 pF LT5512
) ( ) (|
ground - ----------- -----------|---------- IN-
3:1 1:1
Coilcraft Coilcraft
WBC3-1TL WBC1-1TL

The 3:1 transformer converts the unbalanced 50 ohm input to 16.67
ohms.
The 1:1 center tap transformer converts the unbalanced 16.67 ohms to a
balanced 16.67 ohms. The center tap also supplies a DC ground for
biasing the LT5512 inputs. The 6 pF capactor reactance is:

Frequency Reactance
10MHz 2652.58
240MHz 110.52
450MHz 58.95

placing it in parallel with the LT5512 inputs results in:

Frequency Impedance
10MHz 1/(1/(18.2 + j0.14) + 1/2652.58) = 18.21
240MHz 1/(1/(18.1 + j2.8) + 1/110.52) = 17.58
450MHz 1/(1/(18.1 + j5.2) + 1/58.95) = 16.7

Questions:

1) How off base is my simple analysis?

2) Is there a better way to do this?

3) How significant is the 1.6 ohm mismatch at 10 MHz?

I'm working on a homebrewed receiver and am looking at using either
the
AD8343 or LT5512 as the mixer. They seem very similar in
capabilities.
The AD8343 appears to have slightly better LO to IF port isolation but
a more complication input biasing.

What the tradeoffs of using the AD8343 vs LT5512 for converting
.5-600 MHz RF to 140 MHz IF?

Hi There,

The Bishop Druit College Radio Club
http://www.qsl.net/mm0axl/mncarg/bdc.html
situated in the Mid North Coast of NSW Australia at Coffs Harbour are
looking forward
to making Local or DX IRLP contacts on Fridays 0315 - 0345 UTC.

Contacts will be on IRLP node 6625 via local repeater VK2RDO on 146.650Mhz.

The young people in the club have been experimenting with building simple FM
radio recievers, and have been contemplating the design of plasma balls
using ordinary light
globes and car spark coils.

Contacts with interested parties or similar school electronic/radio groups
would be great but unfortunately the club only has limited time during the
local
lunchtime period.

If interested and can help arrange a contact please email:

Gary VK2ZKT gryan@bdc.nsw.edu.au

or

Peter VK2EVB vk2evb@wia.org.au

There's no need to worry about such a small mismatch. Especially if you will be connecting the antenna directly to the input, you're pretty much guaranteed that the source won't be 50 ohms at any but a very few spot frequencies. It will have reactance and resistance that varies all over the map. But even if it's driven from an amplifier, I can guarantee that between the transformer(s), the layout, and the amplifier itself, you won't have a match within 10% over very much of that wide band.

You can use the freeware RFSim99 to play lots of "what-if" games, including seeing how much loss there really is for various impedance mismatches. RFSim99 also comes with a program called "spur search" that you may find useful in indentifying mixer spurs (and intermod products).

In any event, you likely will end up being more interested in the noise figure than in the power match; you'll want to match for lowest noise, which is essentially never the same as matching for best power transfer.

Another thing you should be careful about is selectivity: if you let everything from the AM broadcast band up through UHF TV into the input, you will be letting in some big signals along with the presumably small ones you will be interested in, and distortion products will limit what you'll be able to hear. It's customary to put some selectivity ahead of the first less-than-stellar-linearity parts such as that mixer. If you had a +65dBm input-referred third order intercept, I'd say you could probably do without the selectivity, but much less than that and you'll benefit from selectivity. There are times when you can't do that, like if you want to digitize a wide bandwidth all at once, but it doesn't sound like that's what you are after.

There are some good books on modern receiver design. Maybe your library has one or could get one for you. Even a quick review of the key issues would probably benefit you, if you haven't already done

that.

Cheers,
Tom

1540. Self Osc Problem

Newsgroup: rec.radio.amateur.homebrew

I am building an exciter for my 8000 rig. 6AG7 VFO, 6CL6 buffer and 807 final.

I am plagued with the problem that resonance in the final does not agree with peak power out.

The power peak (watt meter or light bulb) is a considerable twist south of the plate current dip.

Looking at the output on a scope shows nothing strange about the wave shape as the amplitude increases beyond the dip.

I have tried neutralizing with coupled links between the input and output tanks but it makes no difference nor does anything else I have tried.

Any ideas would be welcome.

Hi Jack,

Have you tried the PA without any excitation ?

Do you have an APC in the anode line, and an appropriate RFC to HT
(with good decoupling to chassis) ?

How about grid stoppers ?

Regards,

Mark

Jack, am a believer in the grid dipper,double check the buffer and PA
tuning ,make sure that they are on frequency and not doubling .If 807
has Pi network,make sure cap C1 nd C2 are in ball park for tuning
range of each band..Handbook wll give these values...Unplug 807 and
make sure the 6AG7 is on freq and on resonance.. think you hae a good
choice with tube lineup.just need to get it to settle down...GL 73

It would help to get more details from you. What frequency is all of this for? Link-tank output? Or pi-network? Are the coils of the tank/pi-net according to specification (from some plans)? Do you know that the VFO is on frequency? Are you doubling in the 6CL6?

> I am plagued with the problem that resonance in the final does not agree with
> peak power out.

Can you removed B+ from the VFO and twist your driver and final tune knobs and get dips in plate, grid current (signs of self-oscillation)? Do you generate grid bias in the final from a grid power supply or rectified drive power?

I have had some experience with matching networks between the final and the load having slight disagreements between peak output power and maximum dip in plate current. Not to worry if the difference is slight.

Most important: find out if the final is self-oscillating (remove drive and rotate final tuning knob to see if there is any wiggle in plate current at any point).

> The power peak (watt meter or light bulb) is a considerable twist south of
> the plate current dip.

What is a considerable twist? five degrees of arc? or 45 degrees of arc? What is your load? Dummy load?

> Looking at the output on a scope shows nothing strange about the wave shape
> as the amplitude increases beyond the dip.

All sine waves should look like sine waves.

> I have tried neutralizing with coupled links between the input and output
> tanks but it makes no difference nor does anything else I have tried.

This can be very difficult to do. If your frequency is HF or low HF you shouldn't have to do this. Most old commercial HF tube rigs did not have neutralization and they worked fine.

> Any ideas would be welcome.

You do have the screen grids grounded through good RF bypass capacitors, right? Once I forgot to add these to a 6146 amp and it self-oscillated at 160 meters (it should not do that) until I put in a good screen to ground

bypass capacitor.

Another area where you have to look out for a mistake is if you have the coil/inductor at the grid input of the final located where it can pick up the magnetic field from the final plate output coil/inductor, which can contribute to making the final just a self-excited oscillator.

So, the next question is: if you get a dip in the final plate current at some position of the plate tuning capacitor, then does that final plate current change if you also tune the grid input capacitor? If yes, then your final has a configuration to make itself a self-excited oscillator, and the next thing is to look for how feedback can be contributing to that.

What's APC?
>
> Any chance of a photo to look at construction techniques ?

Sure. http://schmidling.com/807a.jpg

Needs a little cleaning up. Note the careful placement of the grid coil
at right angles to the final and with the Masonite panel between for
good shielding.

Hi Jack,

Grid stoppers: A low value resistor (100 ohms) attached directly between G2 and the screen supply to reduce the incidental Q of circuit. Same applies to G1.

APC - Anti Parasitic Choke. A few turns (10 ?) of 22AWG enameled copper wire around the out side of and terminated with a 10 ohm 1W resistor. If the AMP becomes unstable at VHF, the reactance of the small inductor will increase and the 10 ohm resistor will dampen the mayhem.

See http://www.somis.org/Oct88qst.html

>From your photo, I think you may need to considerably reduce the length of your wiring before you should tackle stability issues. Anode circuits should be above chassis, grid below chassis and never the twain should intertwine. It looks like you make have lots of inductive coupling between the two at the moment (long wires etc.) which may well be the cause of your problems.

Also take care of proper de-coupling - directly to chassis with minimum lead lengths (1 inch max ?).

Get a 1960s copy of the ARRL handbook and read up on HF amplifier construction techniques. There has been plenty written.

Regards,

Mark.

Hi Jack,

Grid stoppers: A low value resistor (100 ohms) attached directly between G2 and the screen supply to reduce the incidental Q of circuit. Same applies to G1.

APC - Anti Parasitic Choke. A few turns (10 ?) of 22AWG enameled copper wire around the out side of and terminated with a 10 ohm 1W resistor. If the AMP becomes unstable at VHF, the reactance of the small inductor will increase and the 10 ohm resistor will dampen the mayhem.

See http://www.somis.org/Oct88qst.html

>From your photo, I think you may need to considerably reduce the length of your wiring before you should tackle stability issues. Anode circuits should be above chassis, grid below chassis and never the twain should intertwine. It looks like you make have lots of inductive coupling between the two at the moment (long wires etc.) which may well be the cause of your problems.

Also take care of proper de-coupling - directly to chassis with minimum lead lengths (1 inch max ?).

Get a 1960s copy of the ARRL handbook and read up on HF amplifier construction techniques. There has been plenty written.

I have read that these are better built with a bit of resistance wire,
because the inductor is reputed to sometimes work too well.

I dunno the details though -- all my work ends up being QRP, so I
haven't had occasion to make such a beastie.

OK but the supply is a 12K resistor from the plate supply. Guess I
don't see what a 100 in series with this would do.

>Same applies to G1.

Where does that go? There is a 47K grid leak going through the meter to
ground and a coupling cap from the driver.

So what is this grid stopper supposed to do?

> APC - Anti Parasitic Choke.

Roger. The A caused a brain cramp. I have one in there.

Hi Jack,

See if you can find a project called "A 75 to 120 Watt CW transmitter"
in any of your ARRL manuals, (1973 ?).

Z1 is the APC, RFC4 is the anode RFC, there is a 10R grid stopper on
G1 (pin 5), Decoupling abounds (including the heaters), band switch
shorts unused turns of the output inductor, top chassis shows anode
wiring only, bottom chassis shows grid and drive electronics.

I haven't read the whole article yet, but it seems like a well
designed beastie and a good starting point.

Keep a change of fresh underwear next to the rubber gloves :)

Regards,

Mark

ERK! - looks like a 6146 PA, rather than an 807. And, congrats at the attempt, (LOVE the agricultural look - wheres the PTO for the chaff cutter?) BUT theres too much loose wiring providing stray coupling paths - AND you do need to use a metal chassis, even if only to separate the input/output circuitry. A piece of light gauge aluminium sandwiched(sp?) on top of your present chassis would do it.....easy to work with simple tools, no bends.....or do what the old timers did, go to the supermarket, buy a sheetmetal baking tray from the Homewares section)

BTW - while your there, buy one of those cheap white plastic kitchen cutting boards - easy to work, a lovely source of insulating material for standoffs, insulators etc...

And whats with the 3 big wire wound resistors? - screen supply to the PA - what a potential source of stray coupling. A 1 watt resistor is usually sufficient, you wont need the string of 10 watt ones.... (especially sitting under the lead from the anode of your PA stage..)

And the anode tuning is about 100 yards from the tube! - can you get it any closer?

So saying all that, general rule of RF stability is to bypass EVERYTHING, including any existing bypass circuitry. (This is why a metal chassis is so good...no long leads on bypass caps)In this HF cct, a handful of 0.1 or even 0.01 caps would be a good try....wack em everywhere. Go buy heaps, they will be most useful for other stuff as well. 630V polyester/polystyrene are easily and commonly and cheaply available...

And keep going - its worth the effort -

Andrew VK3BFA.

Hi Andrew,

Yes, the example I quoted was for a 6146, but same construction and
circuit elements apply.

I just wanted to give concrete examples of the elements I was talking
about.

Transmitter in the 1967 ARRL HB used a 6146 in gk on 6m.
The input circuit was 9 turns of #20 spacewound 5/8" dia.
It was center tapped, with the center tap connected to a 7uh
rf choke, other end of the choke was grounded to bias supply
(or 22k 1w resistor for grid leak bias, class C). One end of the
coil goes to the grid of the 6146. The other end of the coil is
connected to ground via a 30pf tuning cap, and also to a probe wire
that serves as one 'plate' of the neutralizing capacitor (the plate
of the tube is the other capacitor plate). This probe wire is simply
moved near the tube till adjustment of the plate tuning capacitor does
not vary the grid current, this indicates the tube is neutralized.

The three cathode connections of the tube are connected together at the
socket by a "Y" shaped piece of copper, this is then grounded at a
single point.

1554. Wanted: Dead Band Module TM-742A

Newsgroup: rec.radio.amateur.homebrew

THESE TIRED TO WORK HARD AND TO HAVE SINGLE MONEY TO PAY ACCOUNTS OR SOMETIMES NOR FOR THAT? THE MONEY IS FOR ALL AND A HARD WORK DESERVES AN EXCELLENT ONE IT PAYS! I OFFER YOU TO BE PART OF THIS AID IN COMMON, BECAUSE THE UNION MAKES THE FORCE, PROVES THE FORCE OF SOLIDARITY BY INTERNET, AYUDATE AND AID TO THE OTHERS PLEASE BEFORE ELIMINATING THIS WARNING, WOULD BE THANKFUL THAT LEA FIRST AND IT MAKES THE DECISION LATER. THIS IS NOT A SWINDLE, IS NOT ILLEGAL, IS NOT NECESSARY TO ABSOLUTELY SELL NOTHING, IS FOR SLUGGISH IS FOR PEOPLE WHO NEED AID AND WANT TO HELP THE OTHERS. MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! (Suggestion: It prints this one article so that it reads it with thoroughness and thus it can include/understand it better and follow his form step by step of application.) HELLO TO ALL. - You need a car, to pay to the initial of your house or department, to pay education of your children, you need very deserved vacations, to lamentably begin a saving or any thing for your family but your pay only reaches to pay the accounts sometimes and nor after that. If you identify yourself with previous, the welcome thing to the club, if in addition you are conscientious that stops to win money is necessary to work always honestly, then east business is for you. It says thus: ORIGINAL MESSAGE While it sailed by these pages of the news, also like you it is doing it now, appeared to me an article similar to this that it said: You can gain thousands of dollars in few weeks with an investment of U.S. $6 dollars (six dollars). Immediately I thought: " OH, no! , another swindle more? ", but like majority of us, the curiosity could more, and I continued reading, and it continued saying: "You will send U.S. $ 1,00 (a dollar) to each one of the 6 names and directions mentioned in this article, later You will write down your name and direction at the end of the list having replaced to I number # 6, and it will at least send or put east article in 200 NEWS GROUPS (there are million of these anywhere in the world). " Note: If one is in another country, must exchange his national a dollars, because in all the countries they change dollars and is easier for all. For that reason we will make this business only with dollars and not complicaremos us. Any trick, the difference from this system to others does not exist, is that you have a list of 6 instead of 5, this means that your average of gain he will be After thinking it time and time again and to consult it with friends, I decided to prove it, I thought that the only thing that it could lose era the value of 6 stamps and U.S. $6 dollars and that it would take it like an investment, truth! I thought that to invest 6 dollars plus the costs of shipment by mail they were a compared triviality with which I give in my work by a pay which I am thankful but that it is not sufficient nor just. As probably many of us were a little worried

about the legality about all this. Then it consults to the Central Mail and they confirmed to me that in fact he was totally legal. I remained astonished and I invested to my U.S. $6 dollars immediately... IMAGINENSE THAT! ... the few days later, I began to receive MONEY by mail! Was happy, like boy with new toy, and very surprised! And it thought that this would finish more in few days and tries to forget to me the subject, in any case already had recovered the investment, but the money continued arriving. In my first week I made between U.S. $20 dollars and $30 dollars. For the end of the second week it had made a total of U.S. $1,000 (thousand dollars)! PODIA NOT TO BELIEVE it! ; in the third week U.S. $10,000 (ten thousand dollars) and still continued arriving more! ; in my fourth week had a total of U.S. $41,000 dollars and this continues arriving more quickly (in my house, they go it opening you exceed and I obtaining "NEWSGROUP". THIS WAS PUT SERIOUS. All this was worth the trouble, the investment of U.S. $6 dollars and 6 stamps, gave its fruits, and to think that I spent more of U.S. $6 dollars weekly in drawings and lottery, and did not pass anything. The truth is that this can pass as long as works conscientiously and placing this warning in the greater possible amount of newsgroup, this works simple, while more people see it, more money I win, but even so I assure to you that you will win much more that putting 6 dollars in the best bank of on credit fixed world of 1 year. You will be receiving money worldwide, of places that nor know and in few days! Possibly he will want to rent a PO. BOX. By the amount of you exceed that it will be receiving. ASEGURESE OF WHICH ALL CORRECT DIRECTIONS ESTEN. Now So that of all this (IT IS WHAT IS GOING IT TO LIKE): Of 200 publications of this one letter in different newsgroup, we say that single receipt 5 replaced (IT IS NECESSARY TO BE PESSIMISTIC). Then I made US$5 Dollars with my name in the position #6, of this letter. Now each one of the people who sent the dollar, also makes a number of 200 publications of this one letter in different newsgroup and single 5 people to each one of the 5 original ones respond, this makes U.S. $25 more than I receive (up to here already I recovered my investment more and), now these 25 people put a minimum of 200 publications of this one letter in different newsgroup with my name in #4 place, and single 5 replaced of each one are received. It would be making other U.S. $125 additional, now these 125 people put a minimum of 200 publications of this letter in different newsgroup with my name in #3 place and single one receives 5 answers each, I I receive an additional one of U.S. $625, OK, Here this the part but amused, each one of these 625 people place puts their letters with other 200 publications of this one letter in different newsgroup with my name in #2 and each one receives only 5 answers. This causes that I receive U.S. $3.125. However these 3,125 people sent their letter and in addition they published this one letter in 200 different newsgroup, with my name in #1 place, and only 5 people respond of the 200 newsgroup, this does that I receive U.S. $15,625 dollars. Of an investment of U.S. $6. - dollars, do not think that he is FABULOUS and as I before said, that single 5 people respond of 200 newsgroup, (the real average is of 20 to 30 people) . IF THEY WANT THEY REMOVE

CALCULATIONS! IF SINGLE 15 PEOPLE RESPOND ..... THIS WOULD BE EQUAL A: In the position #6 =US $ 15,00. - In the position #5=US $ 225,00. - In the position #4=US $ 3,375, 00. - In the position #3 =US $ 50,625, 00 - In position #2=US $ 759,375, 00. - ((((Now the good thing comes, not scare. - In the position #1 ..... (((((U.S. $ 11.390.625, 00))))) ... if, ELEVEN MILLION DOLLARS or EUROS! This is the power of the multiplication of the capital to which all we have right! As I said, this can happen but it is necessary to work intelligently and each one of us must fulfill putting this warning not in 200 but in 400 newsgroup, to send post office to everybody, to make marketing, etc. and all gratuitous means of the powerful Internet virtual, in the end your work will give fruits because you worked with effort, honesty and transparency. Once its name no longer is in the list, removes the last announcement from the newsgroup and sends other U.S. $6 dollars to the names in that list, putting its name in the place # 6 and soon will return to repeat all the process, and to begin to put them in the newsgroup again, which must remember is that million people like You and like I anywhere in the world, they are connected to Internet daily and therefore some will read these articles, so I believe that nobody will have problems to invest to U.S. $6 dollars, and to see if this really works. Some people get to think...."and if nobody responds" ..... to me as it is the possibility that this happens? , if there are thousands and thousands of honest people (who, as we) they look for a way to have financial independence and to pay accounts! , and they are arranged to treat, because "THERE IS no WORSE FIGHT THAN, THE ONE THAT NOT FOR! ", esteem that are 20,000 to 50,000 new users of INTERNET Every day, (in all world). ** REMEMBERS, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, THUS IT WILL WORK WITH COMPLETE CERTAINTY. By the way: if you it defrauds to the people, putting messages with his name and it does not send any money to the others in those lists, you you will not receive ANYTHING almost! SO THAT ALL THIS HAPPENS? BECAUSE IT IS NOT HARVESTED WHAT NOT SOWING. REMEMBER, HAGALO IN HONEST, CLEAN FORM AND CORRECTLY, of way so that it wins money and does not squander the time, if it does, will receive money of all the people who enter this business will obtain positive results, at heart these money are turning around the world, and the people that will thank for it, are the pluses needed anywhere in the world (I do not say of extreme poverty), but people, who by those things of the life are in jams and this them aid to come out ahead. "A THING IS SAFE TO THAT YOU SEND TO HIM ON WITH 1 DOLLAR, BY COMMITMENT VERY SURELY IT WILL PUBLISH TO YOU IN HIS NEXT LISTS IN THE NEWGROUPS AND BY CONSEQUENCE YOU WILL RECEIVE MORE MONEY "... MUST FOLLOW THE RULES OF THE BUSINESS, OR BUT IT WILL SEE ITSELF VERY AFFECTED BY PEOPLE INESCRUPULOSAS, LUCK FOR ALL! You asegúrese to print this article NOW, to remove all the information as she needs it. The process is very easy and consists of 3 (three) simple steps
STEP Nº 1: Obtain 6 sheets of paper and you write in each one of them "PLEASE INCLUDES MY NAME IN HIS LIST OF CORRESPONDENCE Or e MAIL" or "PLEASE ADD MY NAME TO YOUR LIST". Soon, its name also writes, direction and (OPTIONAL: electronic mail or email). And if it wants as

a pretty detail also places in which POSITION appeared each name of the people of its List when You sent your DOLLAR (Ej.: "He was in the 3 position" or" You were in slot 3 ") like making it more complete. That one is, to make money and to pass it well at the same time, everything with good will. Now it doubles this one page where the previous thing has written, around a bill of 1 dollar American, it does not send to checks nor another type of payments, single American Dollars. Póngalo everything within 1 on and mándelo to each one of the 6 listed people, the idea to double the paper around the dollar is for assuring that it is going to arrive at his destiny and THAT IS IMPORTANT. Of another way the people who work in the mail could detect that she is money and to remain with the THOUSANDS of YOU EXCEED that they are to him arriving; so that she recommends herself to surround everything, additionally, in a dark paper or of coal so that she does not see herself through on. What this doing is to create a service and like so, does COMPLETELY LEGAL. From now on this not sending a EURO or DOLLAR to him to some person without any reason, this paying to a EURO or DOLLAR by a legitimate service (I assure to Him, again, that this is completely legal). Immediately afterwards, it sends the 6 you exceed to following directions:

1. Guillermo Jimenez Ramos Urb. Villas de Feliza 154 Calle Lucy Boscana

6. Olga Vargas Egusquiza. Calle Leon Velarde 115 Urb. Los Libertadores San Martin de Porres, Lima (Peru)
VERIFY OF WHICH ALL THE DIRECTIONS ARE CORRECT. STEP Nº 2: Now it eliminates I number #1 of list of above and moves the other names a number upwards (#6 becomes #5, and # 5 it turns #4, etc...) and it adds his NAME AND ITS DIRECTION like #6 of the list. STEP Nº 3: Change everything what creates advisable of this one article, but deal with to maintain it the closest possible thing to the original one. Now it puts his article in at least 200 NEWSGROUP (exists more than 24.000.000 newsgroup), single need 200, but the more it puts, the more money him it will arrive. STEP Nº 4: THIS STEP IS OPTIONAL: You also can send this article to other well-known people or strangers, relatives or friends through electronic mails or e-mails; for which such You will have to make steps previous and in addition to add its email to the correspondence direction and simply to send this article by email or sticking it like message of text or like attached file.

Important: Remember to select, to copy and to stick solely the article or letter of format HTML of the message! NOTE: "OF COURSE, NEWSGROUP CAN SEE THOUSANDS IT or UNTIL MILLION OF PEOPLE WHEREAS an ELECTRONIC MAIL SEES IT THAT or WHO THEY RECEIVE IT ". Here some indications of how introducing itself go to newsgroup: THIS IS IMPORTANT THE MAS PART OF THE BUSINESS OF PLACING THE WARNING WITH TU NAME NOT IN 200, BUT I PROPOSE TO YOU TO PUT IT IN 400 NEWGROUPS OF AS AT LEAST HALF IN EXTRAJEROS. HOW TO HANDLE the "NEWGROUPS in simple steps. Nº 1. - You do not need to write up all this letter to do hers own. He only puts his cursor in the beginning of this letter, clicks and he leaves it pressed and bájelo until the end of the letter and larguelo. All the letter will have to be "shaded". Then, note and clicks in "Edit" or "edition" it arrives of his screen, selects here "to copy" or (Ctrl +C). This will cause that all the letter is in the temporary memory of its computer. Nº 2. - Notepad" or "Word" Opens to a new file "and takes the cursor it arrives of the page in target, Presses "edit" and of the menu it selects "paste" or "to beat" or (Ctrl+V). Now it will have this letter in his computer and will be able to add its name in the place #6 of the list following the instructions of above. Nº 3. - This letter in its new file of notepad like "txt Records Case out " or "text file", and whenever it wants to change something, it will be able to do without problems. BEFORE PUBLISHING THIS ARTICLE IN ANY NEWSGROUP, IT REMEMBERS THAT ALL THE WEBSITES HAVE DIFFERENT INSTRUCTIONS TO PUBLISH ARTICLE IN ITS NEWS either GROUPS or NEWSGROUP the BEST thing IS THAN THEY FOLLOW INSTRUCTIONS OF HOW MAKING IT NEXT VERAN SOME SUGGESTIONS; THESE CAN VARY ACCORDING TO THE VERSIONS OF PROGRAMS, WEBSITES, ETC. FOR WHICH USES INTERNET EXPLORER. IF NO IT KNOWS MUCH OF FORUMS, IT CAN USE THE GOOGLE TO LOOK FOR NEWSGROUP AND BEGINS TO LOOK FOR WHERE TO PLACE ITS WARNING. Nº 4. - Go to newsgroup and you select "post an article" or "to write new message/discussion " in some newsgroup first is selected specific group and later loads the article in publishing new message. Nº 5. - The complete content of txt Marks. case out and you copy using same previous technique. Return to newsgroup "TO NEWS" and "IT STICKS IT" there you this creating and filling with paste this letter within its program or "posting" Presses the button "post" FOR WHICH THEY HANDLE NETSCAPE. Within the Netscape program, it goes to the titled window "Window" and select " NetscapeNews ". Then it chooses of the menu "Options", select "to Show all Newsgroup" Immediately will appear a list of all the newsgroup of their server, click in any newsgroup. Of this newsgroup it clicks underneath "TO NEWS", which would have to be it arrives, in the left end of the newsgroup page This him it took to the box of messages. Nº 6. - Fill east space. This it will be the title that will see all when cross by the list of a group in individual for example puts WINS SAFE, FAST AND LEGAL MONEY SINGLE 6 DOLLARS OF INVESTMENT. Mark complete content of txt cases out and copies using the same technique previous. Return to newsgroup "TO NEWS" and you this creating and filling with paste or sticking this one letter within its program or "posting" Nº 7. - Press "send", that this in the left superior part and you have finalized with its first newsgroup. ..... CONGRATULATIONS!

Everything what must do is to put in different Newsgroup (groups) and
to publish this one letter or article; when it already has practice,
single will take about 30 seconds him by each newsgroup. One it forms
to find NEWSGROUP, it is through the finders and Servants of the News.
REMEMBER: WHILE MAS NEWSGROUP OBTAINS, MAS MONEY ANSWERS WILL RECEIVE!
BUT IT MUST ENTER AT LEAST... 200 NEWSGROUP. AND ALREADY THIS! Single a
note more, if it knows to translate this message to other languages
(it can make it with the Tool Language of Word or by Internet), can in
addition, to insert them in forums of different countries like, the
USA, England, France, Germany, Russia, Brazil, (this I say it like
advice to expand the possibilities that he sees much but people it),
imagines that their mail sees it in China.

> attempt

I thought the "Masonite shielding" would suffice for a smiley.

That was my first attempt at a wooden chassis and it became obvious why
metal is better and I abandoned it a few weeks ago.

It started out xtal controlled but then I got the bug to add a VFO which
is the crap on the left. The 807 turned into an 866 so I substituted
the 6146 till I got another 807. The missing meter was a hamfest
special that bounced so much it was useless and then crapped out completely.

It is now all neatly mounted on a home made aluminum chassis and
unfortunately looks a lot better than it works.

I will take a for real pic tomorrow. That one was just too good not to
share.

> And whats with the 3 big wire wound resistors? - screen supply to the
> PA - what a potential source of stray coupling. A 1 watt resistor is
> usually sufficient, you wont need the string of 10 watt ones....

One of the plans I was working for called for 25W. Seems like a
misprint because it does not even get warm. The 10K in the VR150 leg
gets hotter than hell and probably should be 25W. I burned my finger
just checking it.

>And the anode tuning is about 100 yards from the tube! - can you get
it any closer?

If you look closely, you can see the 807 socket between the 6146 and the
cap. The 6146 is where the other 6ag7 is supposed to be.

> And keep going - its worth the effort -

It's been a challenge. I made a simpler version of this as a kid and am
sort of re-living my childhood. It's like a Mr Wizzard Science project
for me.

I am now plagued with real test equipment and can't play "ignorance is
bliss".

>
> I thought the "Masonite shielding" would suffice for a smiley.

It did - I just didn't want to spend the next 3 weeks figuring out how to put one in.....(bloody computers)

And thanks for the explanation - I didn't see the 807 socket, and didn't know there was a VR150(was it?) in there as well. And the extraneous tuning stuff to the left, well, now I know its for a VFO. (Gee, voltage regulation - thats getting fancy - yes, the dropper resistors do run stinking hot, don't they....)

Strangely enough, theres a fault in human design in that the nerve endings that detect heat are a lot bloody slower than everything else - by the time we figure out its too hot, the damage is done....

And must admit to wallowing in nostalgia - mine attempts were similar, and probably oscillated all over the place as well - BUT without virtually any test gear, (or knowledge) it didn't seem to matter - there was no one to complain anyway, the bands were virtually empty except for other manic experimenters, TV was black and white, and broadcast was AM. Nothing else to get into - and the bands were harmonically related so we we're QRM other hams anyway....2m was the outer frontier anyway, there was NOTHING used above that....

How about a photo of the latest metal attempt? - remember, if it looks nice and neat, it doesn't really matter if it don't work too good....

I have things here I am not game to connect to the spectrum analyser - don't want my dreams shattered toooo quickly....
but getting back, more and more, into the older stuff - partly fading eyesight (I cant see u-mini smd ic's) and besides, theres something comforting about the warm glow of valves in a dark room, the crash of static from the other side of the world, the thrill of hearing someone on air from an exotic National Geographic land...the reasons we got into amateur radio in the first place..

The bands here at the moment are a total write off everywhere - 80m is S9 noise, the rest not much better. QRM, QRN wall to wall. So, I sit here and type on a keyboard, I guess its still "hamming" after a fashion...

>
> That was my first attempt at a wooden chassis and it became obvious why

Yep. Tubes with gain killed wooden chassis.....

Hah! - silly man - NOW you have to get the VFO stable, as well as all the other problems. And as for 807's - I think about 90% of the people reading this will have some sitting around, just waiting for the "magic moment" of inspiration. Good On Ya Jack - your doing it - good luck!

And the magics still there, even after 30 plus years of experimenting.....cant be killed by the internet, store bought gear, mobile phones - all those glittering toys that didn't even exist exist when we started out.....

And I got boxes of hamfest meters that are probably crappy too - haven't tried to use them yet, so don't know. Finally built myself a rough tube tester a few weeks ago (I had to, trying to find working tubes for a VERY elderly Yaesu FTDX400)

Yep. Its a real PITA that - we cant delude ourselves our home brew QRM generators are not what they are.....still, its an excuse to use some time creatively.....

1558. AD9912 SFDR measurements

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-25 14:18:34 UTC
From: "Gian, I7SWX" <i7swx@yahoo.com>
Message-ID: <1180102714.162363.193270@p47g2000hsd.googlegroups.com>
Source record: 7447

Hi all,

following my message inserted on may 24th : "Better to use AD9912 and not AD9910", I have received several enquiries about any test done on the AD9912.

Yes, my good friend Giuliano, I0CG (of AD9951 DDS fame), is performing measurements on the AD9912 and also comparisons with his already well known and appreciated DDS using AD9951 and a 500MHz clock.

I have uploaded a document in:
http://groups.yahoo.com/group/emrfd/files/
http://www.hamsdr.com/dnld.aspx
http://groups.yahoo.com/group/softrock40/files/

with title: "AD9912 SFDR tests.pdf "

The document reports some Spectrum analyzer measurements on the AD9912 and also one comparison with AD9951.

When I0CG will release further reports I will divulgate them.

And just what does this SPAM have to do with homebrewing?

This is the problem with the UNMODERATED NG's on the internet - you keep getting all this CRAP!!!!

"brisa" <brisasuave30@hotmail.com> wrote in message news:1180064295.952456.198780@h2g2000hsg.googlegroups.com...
THESE TIRED TO WORK HARD AND TO HAVE SINGLE MONEY TO PAY ACCOUNTS OR SOMETIMES NOR FOR THAT? THE MONEY IS FOR ALL AND A HARD WORK DESERVES AN EXCELLENT ONE IT PAYS! I OFFER YOU TO BE PART OF THIS AID IN COMMON, BECAUSE THE UNION MAKES THE FORCE, PROVES THE FORCE OF SOLIDARITY BY INTERNET, AYUDATE AND AID TO THE OTHERS PLEASE BEFORE ELIMINATING THIS WARNING, WOULD BE THANKFUL THAT LEA FIRST AND IT MAKES THE DECISION LATER. THIS IS NOT A SWINDLE, IS NOT ILLEGAL, IS NOT NECESSARY TO ABSOLUTELY SELL NOTHING, IS FOR SLUGGISH IS FOR PEOPLE WHO NEED AID AND WANT TO HELP THE OTHERS. MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! MAKES SAFE MONEY LEGALLY, FAST AND VIA INTERNET! (Suggestion: It prints this one article so that it reads it with thoroughness and thus it can include/understand it better and follow his form step by step of application.) HELLO TO ALL. - You need a car, to pay to the initial of your house or department, to pay education of your children, you need very deserved vacations, to lamentably begin a saving or any thing for your family but your pay only reaches to pay the accounts sometimes and nor after that. If you identify yourself with previous, the welcome thing to the club, if in addition you are conscientious that stops to win money is necessary to work always honestly, then east business is for you. It says thus: ORIGINAL MESSAGE While it sailed by these pages of the news, also like you it is doing it now, appeared to me an article similar to this that it said: You can gain thousands of dollars in few weeks with an investment of U.S. $6 dollars (six dollars). Immediately I thought: " OH, no! , another swindle more? ", but like majority of us, the curiosity could more, and I continued reading, and it continued saying: "You will send U.S. $ 1,00 (a dollar) to each one of the 6 names and directions mentioned in this article, later You will write down your name and direction at the end of the list having replaced to I number # 6, and it will at least send or put east article in 200 NEWS GROUPS (there are million of these anywhere in the world). " Note: If one is in another country, must exchange his national a dollars, because in all the countries they change dollars and is easier for all. For that reason we will make this business only with dollars and not complicaremos us. Any trick, the difference from this system to others does not exist, is that you have a list of 6 instead of 5, this means that your average of gain he will be After thinking

it time and time again and to consult it with friends, I decided to
prove it, I thought that the only thing that it could lose era the
value of 6 stamps and U.S. $6 dollars and that it would take it like
an investment, truth! I thought that to invest 6 dollars plus the
costs of shipment by mail they were a compared triviality with which I
give in my work by a pay which I am thankful but that it is not
sufficient nor just. As probably many of us were a little worried
about the legality about all this. Then it consults to the Central
Mail and they confirmed to me that in fact he was totally legal. I
remained astonished and I invested to my U.S. $6 dollars immediately...
IMAGINENSE THAT! ... the few days later, I began to receive MONEY by
mail! Was happy, like boy with new toy, and very surprised! And it
thought that this would finish more in few days and tries to forget to
me the subject, in any case already had recovered the investment, but
the money continued arriving. In my first week I made between U.S. $20
dollars and $30 dollars. For the end of the second week it had made a
total of U.S. $1,000 (thousand dollars)! PODIA NOT TO BELIEVE it! ; in
the third week U.S. $10,000 (ten thousand dollars) and still continued
arriving more! ; in my fourth week had a total of U.S. $41,000 dollars
and this continues arriving more quickly (in my house, they go it
opening you exceed and I obtaining "NEWSGROUP". THIS WAS PUT SERIOUS.
All this was worth the trouble, the investment of U.S. $6 dollars and
6 stamps, gave its fruits, and to think that I spent more of U.S. $6
dollars weekly in drawings and lottery, and did not pass anything. The
truth is that this can pass as long as works conscientiously and
placing this warning in the greater possible amount of newsgroup, this
works simple, while more people see it, more money I win, but even so
I assure to you that you will win much more that putting 6 dollars in
the best bank of on credit fixed world of 1 year. You will be
receiving money worldwide, of places that nor know and in few days!
Possibly he will want to rent a PO. BOX. By the amount of you exceed
that it will be receiving. ASEGURESE OF WHICH ALL CORRECT DIRECTIONS
ESTEN. Now So that of all this (IT IS WHAT IS GOING IT TO LIKE): Of
200 publications of this one letter in different newsgroup, we say
that single receipt 5 replaced (IT IS NECESSARY TO BE PESSIMISTIC).
Then I made US$5 Dollars with my name in the position #6, of this
letter. Now each one of the people who sent the dollar, also makes a
number of 200 publications of this one letter in different newsgroup
and single 5 people to each one of the 5 original ones respond, this
makes U.S. $25 more than I receive (up to here already I recovered my
investment more and), now these 25 people put a minimum of 200
publications of this one letter in different newsgroup with my name in
#4 place, and single 5 replaced of each one are received. It would be
making other U.S. $125 additional, now these 125 people put a minimum
of 200 publications of this letter in different newsgroup with my name
in #3 place and single one receives 5 answers each, I I receive an
additional one of U.S. $625, OK, Here this the part but amused, each
one of these 625 people place puts their letters with other 200
publications of this one letter in different newsgroup with my name in

#2 and each one receives only 5 answers. This causes that I receive
U.S. $3.125. However these 3,125 people sent their letter and in
addition they published this one letter in 200 different newsgroup,
with my name in #1 place, and only 5 people respond of the 200
newsgroup, this does that I receive U.S. $15,625 dollars. Of an
investment of U.S. $6. - dollars, do not think that he is FABULOUS and
as I before said, that single 5 people respond of 200 newsgroup, (the
real average is of 20 to 30 people) . IF THEY WANT THEY REMOVE
CALCULATIONS! IF SINGLE 15 PEOPLE RESPOND ..... THIS WOULD BE EQUAL
A: In the position #6 =US $ 15,00. - In the position #5=US $ 225,00. -
In the position #4=US $ 3,375, 00. - In the position #3 =US $ 50,625,
00 - In position #2=US $ 759,375, 00. - ((((Now the good thing comes,
not scare. - In the position #1 ..... (((((U.S. $ 11.390.625,
00))))) ... if, ELEVEN MILLION DOLLARS or EUROS! This is the power of
the multiplication of the capital to which all we have right! As I
said, this can happen but it is necessary to work intelligently and
each one of us must fulfill putting this warning not in 200 but in 400
newsgroup, to send post office to everybody, to make marketing, etc.
and all gratuitous means of the powerful Internet virtual, in the end
your work will give fruits because you worked with effort, honesty and
transparency. Once its name no longer is in the list, removes the last
announcement from the newsgroup and sends other U.S. $6 dollars to the
names in that list, putting its name in the place # 6 and soon will
return to repeat all the process, and to begin to put them in the
newsgroup again, which must remember is that million people like You
and like I anywhere in the world, they are connected to Internet daily
and therefore some will read these articles, so I believe that nobody
will have problems to invest to U.S. $6 dollars, and to see if this
really works. Some people get to think...."and if nobody responds" .....
to me as it is the possibility that this happens? , if there are
thousands and thousands of honest people (who, as we) they look for a
way to have financial independence and to pay accounts! , and they are
arranged to treat, because "THERE IS no WORSE FIGHT THAN, THE ONE THAT
NOT FOR! ", esteem that are 20,000 to 50,000 new users of INTERNET
Every day, (in all world). ** REMEMBERS, HAGALO IN HONEST, CLEAN FORM
AND CORRECTLY, THUS IT WILL WORK WITH COMPLETE CERTAINTY. By the way:
if you it defrauds to the people, putting messages with his name and
it does not send any money to the others in those lists, you you will
not receive ANYTHING almost! SO THAT ALL THIS HAPPENS? BECAUSE IT IS
NOT HARVESTED WHAT NOT SOWING. REMEMBER, HAGALO IN HONEST, CLEAN FORM
AND CORRECTLY, of way so that it wins money and does not squander the
time, if it does, will receive money of all the people who enter this
business will obtain positive results, at heart these money are
turning around the world, and the people that will thank for it, are
the pluses needed anywhere in the world (I do not say of extreme
poverty), but people, who by those things of the life are in jams and
this them aid to come out ahead. "A THING IS SAFE TO THAT YOU SEND TO
HIM ON WITH 1 DOLLAR, BY COMMITMENT VERY SURELY IT WILL PUBLISH TO YOU
IN HIS NEXT LISTS IN THE NEWGROUPS AND BY CONSEQUENCE YOU WILL RECEIVE

MORE MONEY "... MUST FOLLOW THE RULES OF THE BUSINESS, OR BUT IT WILL SEE ITSELF VERY AFFECTED BY PEOPLE INESCRUPULOSAS, LUCK FOR ALL! You aseg&#65533;rese to print this article NOW, to remove all the information as she needs it. The process is very easy and consists of 3 (three) simple steps
STEP N&#65533; 1: Obtain 6 sheets of paper and you write in each one of them "PLEASE INCLUDES MY NAME IN HIS LIST OF CORRESPONDENCE Or e MAIL" or "PLEASE ADD MY NAME TO YOUR LIST". Soon, its name also writes, direction and (OPTIONAL: electronic mail or email). And if it wants as a pretty detail also places in which POSITION appeared each name of the people of its List when You sent your DOLLAR (Ej.: "He was in the 3 position" or" You were in slot 3 ") like making it more complete. That one is, to make money and to pass it well at the same time, everything with good will. Now it doubles this one page where the previous thing has written, around a bill of 1 dollar American, it does not send to checks nor another type of payments, single American Dollars. P&#65533;ngalo everything within 1 on and m&#65533;ndelo to each one of the 6 listed people, the idea to double the paper around the dollar is for assuring that it is going to arrive at his destiny and THAT IS IMPORTANT. Of another way the people who work in the mail could detect that she is money and to remain with the THOUSANDS of YOU EXCEED that they are to him arriving; so that she recommends herself to surround everything, additionally, in a dark paper or of coal so that she does not see herself through on. What this doing is to create a service and like so, does COMPLETELY LEGAL. From now on this not sending a EURO or DOLLAR to him to some person without any reason, this paying to a EURO or DOLLAR by a legitimate service (I assure to Him, again, that this is completely legal). Immediately afterwards, it sends the 6 you exceed to following directions:

1. Guillermo Jimenez Ramos Urb. Villas de Feliza 154 Calle Lucy Boscana
Mayaguez, Puerto Rico 00680-7301
2. Mirta Weise. Calle: Eustaquio Fr&#65533;as 4361(Ingeniero Pablo Nogu&#65533;s)
C&#65533;digo Postal:1613 Buenos Aires Argentina
3. Jaime Cruz Ravelo Calle 69 Sur No. 102C-24 Bq 6 Apto 307 Ciudadela La Libertad II Etapa Bogota D.C. (Colombia)
4. Edgar Fernando Gerardo Moreno. Calle Tarento 116 Entre Roma y N&#65533;poles Cluster 12 Col. Hacienda Santa F&#65533; C.P. 45655, Tlajomulco de Zu&#65533;iga, Jalisco (Mexico)
5. Ursula Maria Mora Devoto. Calle Manuel Quiroz 180 Dpto. 208 Santiago
de Surco, Lima (Per&#65533;)
6. Olga Vargas Egusquiza. Calle Leon Velarde 115 Urb. Los Libertadores San Martin de Porres, Lima (Peru)
VERIFY OF WHICH ALL THE DIRECTIONS ARE CORRECT. STEP N&#65533; 2: Now it eliminates I number #1 of list of above and moves the other names a number upwards (#6 becomes #5, and # 5 it turns #4, etc...) and it adds his NAME AND ITS DIRECTION like #6 of the list. STEP N&#65533; 3: Change

everything what creates advisable of this one article, but deal with
to maintain it the closest possible thing to the original one. Now it
puts his article in at least 200 NEWSGROUP (exists more than
24.000.000 newsgroup), single need 200, but the more it puts, the more
money him it will arrive. STEP N° 4: THIS STEP IS OPTIONAL: You also
can send this article to other well-known people or strangers,
relatives or friends through electronic mails or e-mails; for which
such You will have to make steps previous and in addition to add its
email to the correspondence direction and simply to send this article
by email or sticking it like message of text or like attached file.
Important: Remember to select, to copy and to stick solely the article
or letter of format HTML of the message! NOTE: "OF COURSE, NEWSGROUP
CAN SEE THOUSANDS IT or UNTIL MILLION OF PEOPLE WHEREAS an ELECTRONIC
MAIL SEES IT THAT or WHO THEY RECEIVE IT ". Here some indications of
how introducing itself go to newsgroup: THIS IS IMPORTANT THE MAS PART
OF THE BUSINESS OF PLACING THE WARNING WITH TU NAME NOT IN 200, BUT I
PROPOSE TO YOU TO PUT IT IN 400 NEWGROUPS OF AS AT LEAST HALF IN
EXTRAJEROS. HOW TO HANDLE the "NEWGROUPS in simple steps. N° 1. - You
do not need to write up all this letter to do hers own. He only puts
his cursor in the beginning of this letter, clicks and he leaves it
pressed and b°jelo until the end of the letter and larguelo. All the
letter will have to be "shaded". Then, note and clicks in "Edit" or
"edition" it arrives of his screen, selects here "to copy" or (Ctrl
+C). This will cause that all the letter is in the temporary memory of
its computer. N° 2. - Notepad" or "Word" Opens to a new file "and
takes the cursor it arrives of the page in target, Presses "edit" and
of the menu it selects "paste" or "to beat" or (Ctrl+V). Now it will
have this letter in his computer and will be able to add its name in
the place #6 of the list following the instructions of above. N° 3. -
This letter in its new file of notepad like "txt Records Case out " or
"text file", and whenever it wants to change something, it will be
able to do without problems. BEFORE PUBLISHING THIS ARTICLE IN ANY
NEWSGROUP, IT REMEMBERS THAT ALL THE WEBSITES HAVE DIFFERENT
INSTRUCTIONS TO PUBLISH ARTICLE IN ITS NEWS either GROUPS or NEWSGROUP
the BEST thing IS THAN THEY FOLLOW INSTRUCTIONS OF HOW MAKING IT NEXT
VERAN SOME SUGGESTIONS; THESE CAN VARY ACCORDING TO THE VERSIONS OF
PROGRAMS, WEBSITES, ETC. FOR WHICH USES INTERNET EXPLORER. IF NO IT
KNOWS MUCH OF FORUMS, IT CAN USE THE GOOGLE TO LOOK FOR NEWSGROUP AND
BEGINS TO LOOK FOR WHERE TO PLACE ITS WARNING. N° 4. - Go to newsgroup
and you select "post an article" or "to write new message/discussion "
in some newsgroup first is selected specific group and later loads the
article in publishing new message. N° 5. - The complete content of txt
Marks. case out and you copy using same previous technique. Return to
newsgroup "TO NEWS" and "IT STICKS IT" there you this creating and
filling with paste this letter within its program or "posting" Presses
the button "post" FOR WHICH THEY HANDLE NETSCAPE. Within the Netscape
program, it goes to the titled window "Window" and select "
NetscapeNews ". Then it chooses of the menu "Options", select "to Show
all Newsgroup" Immediately will appear a list of all the newsgroup of

their server, click in any newsgroup. Of this newsgroup it clicks
underneath "TO NEWS", which would have to be it arrives, in the left

1560. Need 2SC1971 transistor in TO-220

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-05-25 14:58:51 UTC
From: Paul Ferguson <Paul@PaulFerguson.us>
Message-ID: <g6ud53l5rreqp4buq5l8m5pvkfppmj1vlk@4ax.com>
Source record: 7349

I have a DSW-II-20 QRP rig that needs a replacement RF power transistor type 2SC1971 in a TO-220 package.

I have looked at places I order from like Mouser, Digikey, Newark, but they do not have it. I need only a quantity of one but will buy 2.

Does anyone know of a source?

Paul

John , Yes it is c**p ,but you don't have to read it .
It also applies to 'legit' NG messages for in which you might not have
any interest. The 'next message' button is your friend.

I just posted one to http://schmidling.com/807b.jpg

Unfortunately, it now looks better than it works.

> Hah! - silly man - NOW you have to get the VFO stable, as well as all
> the other problems.

I faded out of ham radio because it was boring me to death once I "moved up" to a rice box. My born-again career keeps me interested because hardly anything works very well.

I finally gave up on keying the oscillator because of chirp but now it drifts so badly, I still can't use it.

It's an interesting problem though that sort of defies my analytical skills.

When I turn on the osc, it drifts up several hundred cycles in a few seconds and stops. I can find no voltage changing like that, I moved all the hot stuff out just to test that and I am stumped. It seems like it is in the tube itself.

I am now keying the grid bias of the osc and there is no chirp but it does that several second climb that would be frowned upon.

Long term stability is another problem but in the noise at this point.

Do you or anyone happen to have a couple of 1000 pf zero TC caps? I am using cheapo ceramics and they are not so good. Blowing on them through a straw has a rather profound effect on the freq.

Interestingly, if I hook it up to a Variac, I don't get 200 hz change until I get below 75VAC. This is rather amazing to me and points to a temp rather than voltage problem.

BTW, this started out as an exciter for the 8000 rig but I have since gotten the bug to make a CW rig out of it. Again, the rice box is too perfect in that mode also for my interest.

And it LOOKS very nice...why no shielding around the vfo assembly? -
the sudden temp druft is possibly something suddenly stabilizing as it
warms up - BTW - polystyrene caps are a better substitute for disc
ceramics, especially old ones...

Source record: 7362

Hi!. I am trying to devise a varactor (varicap) tuned dip meter, that
can also work as wavemeter by turning the oscillator off.
The target is to reach up to 1GHz by exchanging coils (each with its
own complete oscillator), but needing as few as possible of them.
The main problem with the prototype is at the low end of each band:
even with back-to-back diodes, the RF amplitude goes lower giving a
false broad dip illusion. This also causes the freq scale divisions
for the dipper do not match those for the passive wavemeter.
Trying to reduce amplitude with some automatic level control often
gives rise to low f oscillations.
Any idea on low and stable amplitude oscillators?. I've already looked
up in the group and the web.

Polystirene (styroflex) capacitors are a good choice. They have a
desirable slightly negative temperature coefficient, and excellent Q.
1000pF is within the spectrum of usual values.
Or you may choose a bunch of NP0 ceramics in parallel, plus ~1/20th of
the total value made up of a N750 (-750ppm/centigrade) capacitor. Many
paralleled caps are better than a single multilayer unit because heat
(yes, real life caps do heat somewhat in oscillators) is better
dissipated away, thus reducing one of the drift causes.

==========
I support the above opinion ,having made a simple FET based vfo for
3.5-38 MHz which serves as a training tool for the UK Intermediate
Licence practical assessment ,for which trainees have to calibrate a vfo
against a receiver and/or frequency counter.

The VFO was made (semi-ugly style) on PCB board with 'ground' holes
drilled for upright grounded components ,with the other lead to support
the relevant non-grounded components resulting in the shortest possible
interconnections.
Using polystyrene caps and with the VFO not having any buffer stage the
device fed by a 9v PP battery drifts not more than 20 Herz in 30 minutes.

What kind of battery is a 9v PP battery? And, it would likely be helpful to know what the Inductor is that the negative temperature coefficient of the poly cap is compensating for. Is that drift specification for the first 30 minutes after turn on or after the oscillator has been on for a couple of days?

A 9v PP battery is a standard battery pack , alkaline /NiCad / NiMH as
used in all sorts of consumer electronics incl battery operated smoke
alarm devices. Dimensions :45x25x17 mm. Available all over the world.
The battery is 'velcro-ed' to empty space on the board
I did not use dedicated neg temp coeff components ,but used 4 recycled
polystyrene caps from the junk box.

FET is 2N3819 but any other HF FET would do.
The tuning cap is a air variable cap (old style trimmer ,silver plated
plates and ceramic body) with added reduction gear/scale in front panel.
Adjustable inductor with core is from Toko .It is mounted on its side,
soldered to PCB material plane.
There is a compact foil trimmer for fine adjustment

Since double sided PCB board was used , I drilled many holes in the
material and soldered through hole pieces of wire ,such that the 2
copper planes are connected at many places.

The 20 Hz stability is reached after applying power to the circuit for
approx 20 minutes in a room with a stable temp.

The power supply connection to the circuit is via an insulated pin which
sits on a tiny board island (having used a special PCB foil cutter which
removes a tiny ring of copper material) .
Although I also could have used an upright 10 MegaOhms (1/4 W) resistor
serving as pin and 'insulator'.

The unit is built onto an 2mm thick piece of aluminium bent as an L

Summarising : A typical little project using predominently junk box
components, with success resulting from using RF friendly components
and shortest possible connections between frequency determining elements.

I don't have a web site to post to ,but can take a pic and send it to
those interested, by email

You can contact me by e-mail by removing abcxyz from my NG address

And I assume that the PP means Peak to Peak. I'll acknowledge that a battery has a peak Voltage, in this case, something close to 9 Volts. I doubt it could be rated as Peak to Peak which would imply at least a couple of the things wired back to back and providing around 18 Volts. (Peak to Peak speaking of course, not Push Pull, cancelling even harmonics, or even Push-Push, cancelling odd ones.)

The polys have a generally acknowledged negative temperature coefficient and as such must be correcting for something. The inductor is an air wound solenoid, wound on a toroid or perhaps a (for the frequency range spec'd) quite long piece of coaxial cable?

If you observed 20 Hz of drift over a half hour, after a 20 minute warm up, I would be inclined to ask as to the ambient temperature variation during that 30 minute exercise.

========
PP is just an identification for this size of battery like AA and AAA
for 1.2/1.5 V cylindrical batteries
>

=======
The Toko inductor with adjustable core is a canned component frequently
used by homebrewers and still available . It comes in 3 model for
various frequency ranges. In Europe (and that includes Britain ;)) it is
particularly popular by the QRP community.

> If you observed 20 Hz of drift over a half hour, after a 20 minute warm up,

==========
As stated in my previous message ,the above referred freq. drift was
observed at a stable room temperature. In fact it was in an underground
civil defense bunker where a radio club is hosted by the local
Emergency Planning people(a sort of regional FEMA)

> NOT linuxed, have enough trouble with Bill Gates's products.
============================
Having problems with Bill Gates' bloatware is the best possible reason
to move to Linux ,which is free and can be freely and frequently updated
at umpteen repositories world wide.
It takes some effort ,since everything in Linux can be configured by the
users . But that keeps the 'grey matter' in the head active .
Also Linux doesn't need the latest and fastest machine .
I run my system on a motherboard with a 1GHz Athlon processor and 1024MB
of RAM ,from AD 2001.
My advice : GOFOR Linux and enjoy !

No, it's the designator for the type of battery. Just like there used
to be "A Cells" and "B Cells". It's the common 9v battery, as he
explained. They are simply refered to as "PP" in Europe, just as
they have A4 paper over there rather than the 8.5 by 11 inch paper
that's common in North America.

Get out the ruler, and you'll find that his dimensions match the
battery in your smoke detector.

Jack,

New chassis looks great, well done.

It looks like you have a white wire (Anode HT maybe) going to a meter
then through the chassis. This will need some serious de-coupling
(feed through cap) as it enters the chassis otherwise it is going to
radiate in the lower chassis which won't help with the stability
issues. A 'T filter' would be good here, 1mH above deck, a 10nF
feedthrough cap and 1mH below deck.

As Andrew mentions, you also have 'below deck' electronics 'above
deck' in the form of the VFO. This is going to need very tight
screening to avoid feedback and stability issues.

What frequency are you running this unit at - 14MHz ??

Any chance of some higher res photos looking from above the chassis
and from below ?

Regards,

Mark

To me that is a supercomputer class machine; linux kernel development unfortunately is a moving target and your arrows had better be made of recent generation silicon. For those of us who need to target old x86 (386, 486, PI, PII and PIII) and cpus in the embedded space, (ARM7, etc.) I recommend researching the large number of alternative OSs available including *BSD, OpenSolaris, various RTOSes like UCOS-II, FreeRTOS, eCOS, opensource MS-DOS workalikes and others with much smaller footprints, for amateur radio related work unless your intended user applications are linux specific. If you are doing DSP or realtime development, I urge you to consider an RTOS over any *ix.

The linux machines (x86, ARM7 and others) in my domain are all at 2.4.x kernels due to the increasing requirements of newer kernel versions; in fact I maintain some 0.9x and 1.x linux systems for special requirements for their relative simplicity.

Regards,

Michael

This thread has moved off-topic ....my fault , I included the word Linux
in an earlier message .

To most users Linux is just one of many operating systems being an Open
Source replacement for Windows . Nothing more ,nothing less.

It is the result of a rare phenomenon ;'international cooperation' among
hundreds if not thousands of volunteering (usually professional)
enthousiasts across the globe, who through the Internet formed Linux
communities which continue to flourish. This has resulted in an ever
improving operating system now available in a variety of distributions
constituting ultimate freedom, no longer the sole domain of 'geeks' but
of ordinary computer users.
I am glad having embraced Linux.

Here's mine but you probably won't like them.

What is the point of a blog? What does it do but detract from this group? I went there, read your interesting dissertation and would have commented but for having to sign up and putz with a web based format that is much less convenient than usenet or even yahoo.

Furthermore, unless you know some magic, you will never get more than a hand full participants.

.....

I concur will all you said and find that the most interesting aspect of my renaissance in ham radio is being able to afford to buy real test equipment. Everything I did in my first life was with a barely usable multimeter, light bulbs on links and pencils for drawing arcs on RF nodes.

One thing that took me by surprise was the change in solder to the extent that I could hardly perform this most necessary craft when I ran out of 50 year old solder and bought a new roll.

It seems that Ralph Nader has barfed up this craft also. After finding a roll of real solder with tin and lead, things got a lot better. It still does not tin as neatly as the old stuff and most importantly, does not have that good old aroma that I recall from childhood.

I presume that what ever the current flux is, it just does not work or smell like rosin.

Any thoughts?

For the past two weeks, I have been noticing a burning smell coming from my rig http://schmidling.com/radio.htm when I buzzard.

I can not tell exactly which deck it is coming from but the power supply has no hint of the smell. This leaves the RF deck and the mod deck. I would have bet on the RF deck as it seems to come through the "window" (hole) in the front panel of that deck but a careful inspection shows not a hint of anything burning or even getting warm other than the tube. There isn't much there to get warm other than the fil trans and the little power trans for the bias supply and they are both cool to the touch.

This brings me to the mod deck and the only thing hot there is the fil trans. I have left the filaments burning for several hours and the smell never happens and the trans only gets moderately warm when not transmitting.

The mod deck is a pair of 813's, zero bias as triodes. The centertap of the fil trans is grounded through the meter.

The question is, what effect does the mod current have on the heat carrying capacity of the filament transformer? Are all 10v 10A trans equal? Does talking create heat in it and could this be the source of the smell?

Lacking a better choice, I bought it from Antique Ele for $54 incl shipping. Seems like a junky little thing compared to the one in the RF deck. It's a Hammond T167S10.

Any thoughts?

Sounds like the rumblings of a grumpy, stodgy old fart!

A blog is a very good venue for posting information that's dynamic and frequently updated. It's a good hybrid between a very focused special-interest newsgroup and a full-blown web site. It's easy for the author to update frequently and It allows a measure of interaction between the writer and the readers. It can contain graphic images and file content that newsgroups and news readers don't want to be bothered with. It's especially good for chronicalling daily progress on projects and other regular postings that a newsgroup might find to be tedious and arcane. You don't have to register yourself if you just want to read it, so I'm not sure what the 'convenience' ran't is about.

A blog definitely has a 'point', and a homebrewer's blog written by someone with Farhan's credentials definitely has a place and a value. Keep up the good work Farhan.

I am building an amplifier

(for schematic see page 5 here:
http://makezine.com/09/crackerboxamp/
)

but when I turn up the gain, I get buzz and can actually hear some
radio broadcasts on it.

I assume I need to shield the circuit, or parts of it...

Would lining the inside of the project case (in this case a cardboard
cracker box) with aluminum foil work?

Incidentally, does anyone know if someone makes a type of "shielding"
spray paint or primer, that you could just spray on a plastic or
cardboard project box, that would provide shielding?

Any help appreciated...

1599. motherboard LED connectors and posts?

http://www.infohq.com/Computer/CompGraphics/AthlonBuild/accessorycons.jpg
http://www.pcper.com/images/reviews/285/install03.jpg

Preferably at a good price, as I am looking to buy a bunch (a couple
hundred).

I have seen 2 or 3 pin connectors are pretty common on motherboards,
but I am mainly looking for one-pin connectors, if available.

I would imagine the posts may just come in strips of wire that you
would cut yourself?

Much appreciated...

Thanks for your reply.

I tried searching for LED connectors and get LEDs. I want the
connectors and posts, not replacement LEDs for a motherboard.

http://www.mouser.com/search/refine.aspx?Ntt=led+connector

What are these known by? If you can name some specific parts that
would help narrow my search, because I'm getting several
categories...

- LED Light Pipes & Mounting Accessories (81 Matches)
- Pin & Socket Connectors (198 Matches)
- Pin & Socket Contacts (17 Matches)
- Terminal Blocks (16 Matches)
- Terminals (93 Matches)

I just want the one pin connector type, with a wire attached, and the
post it would plug onto (which you mount or solder onto the PC
board).

Thanks...

Ah, yes, the connectors are general-purpose, and have nothing to do with LEDs specifically, although this is the context in which you happen to have encountered them; therefore searching on the term "LED" is leading you astray.

There are literally hundreds to choose from, but here are a couple example part numbers I pulled out of the Mouser catalog to point you in the right direction:

Header: Mouser 517-2312-6111tg, 3m 2312-6111tg
Socket: Mouser 517-974-01-02, 3m 929974-01-02 (board mount)

the sockets also come for crimp pin or IDC connections. I think once you stop searching for "LED" you'll be able to find things easily.

>Much appreciated...

Male pin headers and female socket connectors with 0.1" pin
spacing. Also socket contacts (inserts) are often sold
separate from the socket itself.

They can be very expensive from electronics supply houses,
ridiculously so for the female connector and insert.

http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2342-ND&Site=US
http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2301-ND&Site=US

What exactly are you looking for? Straight plastic sockets
with 0.1" pin spacing but do they have to be the very thin
(black in your links) type such that on a row of pins in a
pin header, you could plug in two right next to each other,
OR could the plastic connector body be larger like those
used on fans? The point is that if looking for an
especially low price, one option is surplus electronics
'sites which may have something that would work (or may not)
depending on the requirements beyond the basic # of pins,
spacing and pin size.

You might find them called something else, generically grouped as just "connectors" or slightly more like "pin connectors" at a store/site that doesn't deal with as many connectors and just doesn't follow standard naming practices.

You might check the following surplus sites (and ebay).
http://sales.goldmine-elec.com/
http://www.bgmicro.com/
http://www.allelectronics.com/
http://www.mpja.com/
http://www.excesssolutions.com/

That should be a big help - I just needed some keywords: header,
socket, board mount, IDC.

This would be a way to make certain components (such as pots &
trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and
play" for various prototypes + experiments. The motherboard size
headers are small enough where the leads match the components I'm
using and the pins on a motherboard that LEDs plug into are just the
right size to plug into a solderless breadboard, but are more durable
than the regular breadboard jumper wires.

>You might check the following surplus sites (and ebay).

Thanks again

Thanks for your reply...

No, just normal stranded wire. Is that where the most interference
would be leaking in?

I found shielding paint (see below) - would it help to paint the
inside of the project box with this?

http://www.lessemf.com/paint.html

SUPER SHIELD

Reduce or Eliminate EMI / RFI Interference

Super Shield A general purpose EMI/RFI shielding in a handy aerosol
spray for use on most substrates. Especially good for RF shielding
plastic electronics enclosures. Consists of a tough, durable acrylic
base pigmented with a high purity nickel flake. One to two mil coating
provides 40dB - 50dB shielding across a frequency range of 5 to
1800MHz. About 1600 in²/can coverage at 1.5 mil. Contains no CFC 'S,
NO HCFC'S, ozone friendly. 340g (12 oz) aerosol can. Dries to a dull
gray color. Click to see MSDS

* Surface Resistivity ~0.7 Ohm/sq
* Dry time: 10 minutes at room temperature
* Recoat time: 5 minutes
* Excellent adhesion to most plastics
* Tested as per IEEE Std. 299-1997
* Underwriters Laboratories Recognized File No.: E202609
* NO CFC 'S, NO HCFC'S, Ozone Friendly
* RoHS Compliant

Flammable aerosol, ships by ground only.

Super Shield (Cat. #A285) $24.95

add to cart

For $24.95 plus shipping, that's some mighty expensive shielding. Why not spend about half of that and buy a proper aluminum chassis for it. They offer inherent shielding. You'll have to do a bit of easy drilling to mount the components, but it's well worth the effort, and it looks so much better than a cardboard box.

Surf over to www.mouser.com and search for Bud mini-box. There are quite a number of sizes available; one is sure to fit your needs.
Cheers!!

It would probably be little help. And if you coat the box
with anything conductive, it won't help much unless you can
make a good electrical connection between the coating and

pin 4 of the chip. If you really want to try this, thin brass shim stock cut and folded to fit the box, is probably the best you can get, short of a copper or aluminum box. It is also easily solderable to make the ground connection.

If this amp powered by a battery?

In this configuration, pin 2 is the most sensitive node, and anything connected to it should be surrounded with shielding.

Pins 1 and 8 are also somewhat sensitive so if the gain pot has a metal case, that case should also have a ground wire run to pin 4 to shield the resistive element.

Pin 7 is less sensitive, and since this circuit connects nothing to it, it is probably not involved in the noise.

A 9V battery, although I plugged a 200 mA 9V AC adapter into it and it worked also, though I didn't leave it plugged in that long - maybe if it was in longer it would have fried it. I'm not sure how many mA would be unsafe for this circuit - I looked up 9V batteries to see what the current typically is, but it seems this depends on the circuit. Until I find this out I'll probably just use a 9V "battery eliminator" AC adapter.

The reason I asked is that a battery eliminator will
probably have some hum in its output, and pin 7 is there to
remove most of that interference from getting into the
amplifier.

See the data sheet for the LM386:
http://web.mit.edu/6.115/www/datasheets/LM386.pdf

The supply voltage enters the input to bias the output at
half of the supply voltage, going past pin 7, which is
usually bypassed to ground by 10 uF or more to smooth the
bias current from the supply. Even with a battery supply,
the voltage will bounce around a little from the current
drawn by the output transistors, and bypassing pin 7 helps
reduce that effect, too.

Dont'forget Mendelson's www.meci.com

These outlets will often have very good prices, but sometimes it can be hard to tell exactly what you are getting, and you cannot count on getting the same thing from them next week.

I would suggest you call Digikey and Mouser and have them send you their paper catalog. there are hundreds of very similar connectors, often with very different prices. It is really hard using the web search for these things to locate the best one for your purposes, although Digikey does have a scheme where you can download parts of their catalog as pdf. Mouser probaby does too. Mouser and Digikey seem to have a competition on who can kill the most trees, though ... both of their catalogs are over 3000 pages. You will not make friends with the mailman this way.

You will find that Mouser and Digikey tend to have different pricing, as does Newark. The one that is cheaper for one thing often isn't cheaper for another. I don't think Newark has a paper catalog, unfortunate because they are often cheaper than Mouser and Digikey.

Also be aware that on these types of connectors you sometimes need to buy the pins seperately from the housing.

..

> circuit.
(snip)

The current with the adapter is also controlled by the
attached circuit. The 200 mA rating is the maximum current
the load can draw, before the adapter risks over heating.
The only real risk with the adapter is that, under no load
conditions, its voltage will rise above its 9 volt, full
load rating, enough to damage the chip. All versions of
LM386 can handle a 12 volt supply and are not usually
damaged by 15 volts if little sound is being produced. I
would check the adapter with no load and make sure it does
not produce more than 15 volts.

I think you might be looking for something that was called "daisy chain jumper wire" way back in my wire-wrap days. It came as a spool of flexible, stranded insulated wire about 24 guage or so, with an insulated single pin socket every 5 inches or so. You just counted off the number of jumpers you wanted to interconnect, and snip them off of the roll. The sockets fit over standard .025" square posts quite nicely and allowed testing minor modifications without wrapping on new wires.

They had a multitude of uses. I still have some leds and other things with single 5" wires attached to each leg (each with it's own socket at the end).

I haven't even looked for this stuff for years, and know I hava a half roll tucked away in a box somewhere. If I could only find it I'd at least have a part number and manufacturer to provide. I'll see if I can dig it out sometime in the next couple of days...

Good Luck

The DK1HE "Superdipper" "Dipit"?. Yeah, it's a fantastic idea!. It's
like manually rotating a little forth and back the tuning knob, 400
times a second. A little drawback is its (understandable) complexity.
And it goes up to only 42MHz. The english version is in
www.qrpproject.de/UK/DipItUk.html
If I can't find an already chewed design, I may end up building this
thing, plus some ideas from the DUBUS VHF UHF Technik book by DL7QY,
reaching >1GHz but with the aforementioned amplitude clipping at low
end.
If this is NOT what you have, then I will gladly accept your offer!
Thank you for answering!.

However car batteries can be used very effectively for amateur radio operations by using them as a peak current provider in conjunction with a modest (current wise) PSU.
A nominal 100 W RF SSB transmitter might need say 20 Amperes in the peaks , but (even with audio processing) ,on transmit ,the average current will hardly exceed 8 Amperes and taking into account a 50/50 tx/rx duration ratio , such a transmitter will happily operate for long periods with a say 60Ah car battery and a 6 Amperes power supply unit. And the battery will have a long life. Of course ,to be close to the transceiver the battery will have to be of the sealed variety .

I live a mile away from an AM radio station. Usually it doesn't get into
the amps, but there are/were some amps that we could hear the AM radio
station coming thru. A quick way to eliminate that is to wind a coil
with the guitar cord very close to the plug that goes into the amp. Make
the coil small diameter, 2 or 3 inches. That will choke the signal from
entering the amp. It see's the guitar cord as a long wire antenna. How
many turns? Start with 5 or 6, if that doesn't work try a couple more turns.
Hope this may be of some help.

If you are hearing radio broadcasts, it is because
of two things: 1) The bandwidth of the amp is too
high, and 2) there is nonlinearity (ie rectification)
in the amp, typically the input stage.

You can probably solve this problem simply with
a small RF bypass capacitor across the amp input,
just after the input resistor. Set the RC product to
a microsecond or so.

If you look inside consumer audio amps, you'll
find that shielding is not normally used.

You failed to mention what you have on the input, which can be a factor--if you disconnect any input cables, short your input to ground right at the amp and the unwanted stuff is still there, is is very possible your unwanted signals are coming through the 5K gain pot and its leads. Signals on these leads directly modulate the output. Try this:

Replace the 5K pot with a resistor (say, 1K--the lower the R the higher the gain) soldered right on the board. Disconnect the pot wires completely. If that cures your problem consider eliminating that gain control and just using the volume pot. Otherwise, you could try shielding those wires, with the shield tied to signal ground, though I'm not completely sure that would work. Use stereo shielded cable with both wires in the same shield if possible. Twisting the two wires together may help.

You can also try Mr. Masta's RF bypassing, only on the gain pot inputs as well.

That's a pretty cool trick - so this would mean the radio interference
is coming in through the guitar and/or guitar cable?

Thanks for your reply - that's worth a try.
I was going to try wiring in a foot switch to turn the gain on & off
anyway.

By the way do you know a good online place to order shielded wire
(either stereo or mono)?
I had an old cheap shielded guitar cable I was going to cannibalize
for this, but
I would prefer to find wire that isn't too thick & easy to work with.

I am just plugging an electric guitar directly into the input. I don't have the actual circuit here with me right now but the schematic is here (see page 5):

http://makezine.com/09/crackerboxamp/

I believe the + of the input goes to a 0.01 uF capacitor, the - goes to ground.

BTW can anyone explain how to add an XLR out (either balanced or unbalanced) to directly connect the amp to a mixer or recorder?

Thanks

First of all, any sensitive amplifier needs to be build in a metal box no bigger than is necessary. The box acts as a screen so you have no need to use screen leads inside the box. The circuit you have used has no RF decoupling at the input nor on the supply (the 100uf capacitor on the supply will not decouple very well at RF), I would put a 10n ceramic capacitor across it and, for good measure, a 100n across that!

At the input I would put something like 1n to ground (if your input is a guitar then the pickup will be low impedance so there won't be any effect on it's output. I would also be tempted to put an RF choke in series with the input.

If, as I suspect, you are picking up AM broadcasts coiling the input cable a few times at the input won't have much effect.

I need to vary the frequency of operation of a transceiver IC from 7MHz to 9MHz. The oscillator needs to feed into the crystal oscillator input and crystal oscillator output pins of the IC (the current design does not have a variable oscillator and is just using a crystal). Ideally I would like to control the frequency of the oscillator using the PWM of a micro controller (unfortunately the current micro does not have a DAC). Any ideas on the best way to do this?

I'll differ with you, OM.

He may want to build something that, except for the DDS VFO, is entirely within his capabilities. If he's homebrewing something less complex, and finds the VFO to exceed his skillset (as it might exceed mine), his query is entirely on-topic.

pawludebono@gmail.com,

Don't let the grouches turn you off to homebrewing. They're everywhere. Sometimes -- particularly when my back's bothering me -- I'm one of 'em, but I try not to be.

I am currently doing a project which uses 8-bit PWM to set the freq. of
a L.O. across a 250Hz range; I use a 3-bit DAC to select one of eight
250Hz segments first. The 1st L.O. is a PLL with a 2Khz step size
and 16-bit resolution. The DAC and PWM outputs and a DC offset for
centering are summed and then drive a dual varactor to pull the
xtal of the 2nd L.O. (at 56,305,000Hz center). This gives me 1Hz
resolution.

Your 2MHz range would require a 21-bit PWM for 1Hz VFO resolution
(after scaling); a 16-bit PWM would give you about 30Hz resolution.

To me, a workable solution would involve a combination of PLL and PWM
as I have done (from what I have read I would avoid DDS for reasons
of noise).

Regards,

Michael

I'd avoid using any "canned" Toko style inductors with adjustable cores.
The most stable coil designs don't use adjustable cores, which are
an invitation to thermal instabilities. Especially ferrites or the types
with cups.

Has anyone ever heard of anything like the experiment I am currently concocting? I have taken an Amidon T50-2 toroid form and wrapped it with 57 turns of #32 enamaled wire, giving it an inductance of 16 uH, then wrapped over that layer with 150 turns of #36 wire. The first layer (16 uH) I am using for tuning my home-built active antenna, and am relying on resonance to send a signal through the outer layer, which I *think* should act like a step-up transformer for that signal. This layer is grounded on one end, and feeds into the first stage of amplification on the other. And it does seem to work, only the toroid seems to resonate at around 10 MHz with my tuning capacitor set to 114 pF, when it should (I thought) resonate at something lower, like around 3.7 MHz.

And like I said, the step-up transformer part does seem to work, but I can't tune as low as I would like. Has anyone ever hear of anyone else trying anything like this? If so, what is it called, and where can I find info on the subject?

Many thanks for any help...

Dave

What are you trying to match? I suspect your secondary winding has
a lot of interwinding capacity that might be affecting it's operation.
For a ""step up", it might be easier, and more efficient, just to design
a pi or L matching network to do the transformation... Or, use
tapped windings on the coil used in the tuned circuit. Low impedance
at a lower tap point, impedance and voltage will increase on higher
taps..

Hello Pete,

I'm not actually trying to "match" anything, I am attempting to step up the voltage of the incoming signal from my antenna (a 110' longwire use for SWL) before passing it to my first stage of amplification. I think I see what you mean however, this sounds like an impedance matching setup. And I hadn't thought about the interwinding capacitance. Obviously, I am still

fairly new at this.

I saw a schematic in Joe Carr's Secrets of RF Circuit Design that used a step-up transformer before the first stage of amplification, and that gave me the idea for using my tuning inductors (toroids) with a second winding that might act as a step-up transformer. And it does seem to work, just not withing the frequency range I was expecting. My goal is to pick up Voice of Korea here in Texas, at some level of intelligability. And I am a lot closer to that than I was with the plain-jane tuning setup. Today I picked up their 1500 UTC broadcast, which is something I have never been able to do before. (Talking about how happy Korean children are...) It is still far from perfect however...

Thanks for your input. More food for thought... With time, maybe I'll get what I am looking for.

Dave

For a broadband step up, you'd be better off using a ferrite core untuned
transformer or balun.

Are you using this between the coax and a coax leadin? Or, between the
antenna and RF antenna jack on the receiver?

I am doing this inside of the active antenna case, using the coils used for
tuning the tank circuit. It's really kind of an unusual setup, I gather. I
am trying to use the resonance of the coil, which is in parrallel with my
tuning capacitor, to set up a sympathetic signal in the second layer on
that same coil, and feed this sympathetic signal to my first stage of
amplification. That's the step-up transformer part. The whole thing just
resonates at a higher frequency than I anticipated. Thus my original
question: has anyone heard of this before, and what is it called/where can I
find more info on the subject. Fortunately it still allows me to pull in my
target shortwave station, but it's at the bottom of the tuning range rather

than the top.

Thanks for your help,

Dave

That's comparing apples and bananas. These attacks exploit a
certain security hole in a certain piece of software (in this
case the dc++ client, whatever that is).

While the Echolink software *may* have some kind of security
problems of its own aswell, it's very unlikely that crackers try
to exploit them. There are (compared to P2P stuff) just not
enough users to make it worthwhile.

In any case, the attacks on this dc++ client, even if they are
operating on the very same port as Echolink, are absolutely no
danger or security risk for the Echolink software.

Here is a website that discusses a toroid RF phase shift which works fairly well.

http://www.seboldt.net/k0jd/phase_notes.html

==========

Oh yes, in answer to your other post regarding DDS, look at

http://home.comcast.net/~aa0zz/index.html

This website has a DDS VFO which also provides the 90 degree split. It uses the AD9854 and it is reasonably clean, but it does have low level DDS spurs. It is not exactly low cost, but you do get a reasonably complete design, including the rotary shaft tuning dial interface for controlling the DDS.

Could be but the rumblings happen to be my opinion and the man asked for opinions.

No matter how wonderful a blog could be, the problem still remains of getting people to read them. Everyone knows how to find interest groups on usenet and yahoo but how the hell does anyone find his blog a week after he announces it? It vanishes into the blogosphere. There are millions of them (perhaps billions) out there but only a minuscule fraction of that number with any following at all and even fewer with lots of readers.

His key words would be "home brewing".... Google it and see how long it takes to find him unless you happen to know his name but that's cheating. Actually, you will find hundreds of sites that sell our beer making equipment before you get to any ham radio sites.

I did it and cheated. Turns out he has lots of web pages so it makes the blog even more pointless. How is it any better than a web page? The one or two comments certainly do not justify the extra work... does it?

If someone wants to experiment with a high (power)level mixer, I do
not understand, why that person would have to suffer all the problems
of generating a stable specific frequency.

In fact getting a good frequency source cheaply might in fact be a
good thing to encourage people to do some home brewing.

Hi Dave

Then in effect, you are trying to match a lower impedance to a higher one
since you are trying to increase the voltage gain.

Without knowing the active antenna you're attempting to use, it is kind
of hard to determine what advice to offer. I think you mentioned a 100 foot
long wire... That would have a much lower impedance over the HF range
than a 3 foot whip. If you just want voltage gain, use several turns on
the bottom of the coil for coupling the antenna to the tuned circuit.
The tuned circuit will provide the voltage gain. You will reach a point
where the active antenna will be prone to overload, even with the tuned
preselector input.

I always thought the concept of an "active antenna" was that you had a
short whip and barely loaded it down. The whip itself is connected
to a very high impedance point, and then the active components are
there to transform that into a lower impedance for the receiver.

You basically see the idea in old car radios, where the whip was
connected across the tuned circuit at the input. If you didn't use
the right cable to connect it to the antenna, and if you didn't use
the trimmer to adjust things to compensate for that cable, you'd
lose a lot of signal.

Then solid state devices came along, and that made it much easier
to do the transformation, since they took up less space and didn't
need filament voltage.

A preamp or even preselector is not the same thing as an "active
antenna".

The reactance of the coil at 3.7MHz is about 375 ohms. Your long antenna will likely put an impedance across that tank that's on the same order, or maybe lower, impedance. That will pretty much kill any resonant peak you got from the coil and capacitor.

You should start, perhaps, by realizing that what you are looking for is generally not the largest voltage from the antenna, assuming you can add whatever amplification you want, but rather the best signal to noise ratio or the lowest distortion. In fact, atmospheric noise is so large at these HF frequencies that it doesn't take much of an antenna to pick up more of that atmospheric noise than the receiver will contribute, assuming a decent receiver. Making the signal larger just increases the distortion and the chances that strong signals will cause distortion that covers up the weak ones.

There IS an advantage to having sharply resonant circuits in front of any gain stages in the receiver, because you can use them to get rid of unwanted signals, and preferentially select the signals you want to listen to. But to do that, you need to think more carefully about the design of the resonant circuit.

You may in fact find that it works a lot better if you couple your antenna to the tuned circuit (your toroid core and capacitor) rather

loosely, like with very few turns--perhaps a single turn-- through the core for the antenna connection. Even back in the very early days of radio, the advantages of a sharp resonance achieved by loose coupling to a resonant circuit were understood: they used something called a "loose coupler" that let them adjust the coupling from the antenna to the tuned tank/detector. For best selectivity, couple lightly, just enough to get a usable signal. That means coupling the receiver input lightly to the tuned circuit, too.

Cheers,
Tom

Personally, I'd experiment with the AD9951 DDS chip, it's spurious outputs are very low....

http://www.radioamatore.it/i0cg/add9951.html

However, if somebody wants a DDS for direct conversion experiments, the AD9854 DDS has built in quadrature outputs which make it tempting. This website discusses a complete design and, the kit can be gotten from Kanga.

It is pricy, but in my opinion, it has everything I would need.....

http://home.comcast.net/~aa0zz/index.html

The only drawback is that it's spurious outputs are higher.

There are dozens of kits ... the combination FCC1/FCC2 from Norcal is one, AA0ZZ's has been mentioned as another. Kanga has a board called the PIC-EL II that will accept AmQRP's DDS-60 daughtercard and in conjunction with software available from AA0ZZ's website will do the same, plus, it has the PIC programmer on board, so you can play with various versions of the software. All 3 end up costing about the same. FAR Circuits has a board for the old WB2V model which works reasonably well and ends up considerably cheaper.

If you are concerned about soldering the AD985x chip, there are dozens of folks who do that for a small fee. In fact, if you graze the QRP lists you will discover that there are probably hundreds of folks who love to build kits so much that they are floating in them, and a looking satisfy their addiction by building kits for other people so their XYLs won't scream at the increasing pile of unused electronic gear.

The PIC-EL path is probably the most conducive to experimentation, but the most poorly packaged if your intent is to include it in one of your projects. AA0ZZ's has I-Q outputs if you are interested in exploring SDR. The FAR Circuits board of course includes none of the parts, the Norcal kit is lacking the expensive parts (switches, connectors, etc.)

Already built choices do seem fairly lean.

Hey Pete,

The active antenna is a home-built MFJ-1020A, which has a short whip and an input for an external antenna. The amplifier has the gate of a JFET (2N5486) as the input for the first stage of amplification. I can post a schematic to ABSE if you like.

After reading your last post, I think I am beginning to understand what you mean, about matching impedances. This subject has always been a tough one for me, but it interests me, and now I have a reason to study and learn it. I had no idea that was what I was trying to do.

So, it sounds like I am trying to match a low impedance signal source (the longwire antenna) to a high impedance input (the amplifier.) Is that roughly correct? If so, any idea on where I can find more info on impedance matching?

Thanking you very much for your help...

Dave

Man, I think you are right on the money with this. I get the signal, but
very little ability to "tune" it in, as if the resonant "peak" is very low
(my understanding.)

I am getting more signal than noise, compared to operation without the
active antenna, but it's not exactly "prime".

Yes, yes, that is what I am attempting to do. I am just such a newbie to
RF...

My best results come from using an alligator clip with a foot or so of solid
wire soldered to it, and clipping to the center conductor of the output from
the active antenna while wrapping the wire around the whip antenna of my
Sony 7600GR portable SW radio. This gives me a slightly clearer signal,
even if it is not as loud as pluging the output into the external antenna
connection of the radio. One thing I suspect is that I am using the wrong
type of coax (RG-59). I believe my coax is 75 ohm, and what I probably need
is 50 ohm. Does that sound right? Or am I wrong here?

Thank you so much for your help. I have been working on this for a while,
and think I am getting close to achieving my goal.

Hi again Tom,

BTW, how would I calculate the impedance of the coil mentioned above for matching purposes? Would the ARRL Handbook have info on this? I googled "impedance matching:" and found some good (and interesting) links, but feel I need more.

Thanks again,

Dave

If you want quadrature LO signals, and you are operating below half (or ideally below quarter) of the DDS maximum output frequency, then you might find that the best approach is to use the cleanest DDS chip that you can find with a single output, then filter that to remove the harmonics, DAC images etc. and then square it up with a LVDS receiver or comparator, and divide by 2 or 4 using the flipflops of the divider to generate quadrature. The challenging part would be ensuring that propagation delays don't spoil the quadrature, but it probably wouldn't be any harder than making two matched re-construction filters to use with an I-Q DDS chip. The fact that you end up with quadrature square waves rather than quadrature sine waves is a good thing (not a disadvantage at all) with most kinds of mixer.

Chris

Thanks, Tom,

I ran a single turn of wire from my antenna input through the toriod, and it does give me much better tuning ability. And WWV at least comes in like it's in my back pocket. The 1300 UTC broadcast of Voice of Korea was lost in the noise, but I'm guessing that could just be atmospheric conditions.

Thank you for the input. Any other ideas on how I could sharpen the resonant peak of the tank circuit?

Dave

Well, a VFO is not a complete piece of equipment. It's something that might be integrated into any number of different devices. Yeah, you could hook one straight to an antenna and make a QRP transmitter, but he didn't ask for a QRP transmitter, he asked for a VFO.

Saying that buying a VFO module is not in the spirit of homebrewing may be right for the old-timers who used to make their own resistors by baking carbon and build their own capacitors from mica sheet they dug up in their backyard. Yes, I've met folks like that. But they're remarkably rare.

Even getting away from the issues of lots of homebrewers being uncomfortable with laying out a SMT DDS synth, doing a very well-done temperature compensated LC tuned VFO is something that requires considerable skill. In fact I've done both and found the DDS route to be easier, if less satisfying in the end!

Even manufacturers of major reputation often buy their VFO's and canned crystal oscillators from other sources.

Tim.

I finally got around to replacing the wires from the potentiometer, rheostat, input and speaker out all with shielded cable which worked - 99.9% of the noise is gone. The only noise left is a slight buzz which goes away when my hand touches the guitar strings. (Which leads me to question whether the guitar is properly grounded. Any advice on how to ensure that it is?)

Anyway thanks to everyone for their replies, the shielded wire did the trick.

I have heard there are some tubes that use plate caps that are basically the same as a 6L6.
The only readon I want to use something like this is because of the design of the output transformer
I have. The B+ connection is on the bottom, underside of the chassis, and the plate connection is on the top.

Basically the same as in beam tetrodes in the same power class, yes.
There are tons of them; one good way to figure it out is to get your
hands on an ARRL handbook of the appropriate vintage and go shopping
among the transmitting and horizontal sweep tubes for ones that look likely.

1672. Poor fm,am radio reception--solutions?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-05 19:13:27 UTC
From: Proctologically Violated<antropic3.14decay@optonline2.718.net>

Awl-- (also posted to rra.antenna)

I posted some time ago regarding the tuning circuitry of car radios vs. home radios/stereos.
I had long noticed much superior tuning in car radios over my home radios. Several apparently knowledgeable people on a few radio ngs confirmed this, even explained it, altho this went over my head.

So based on this assumption of tuning superiority, I went to *great lengths* to remove a very nice 6-speaker stereo from a car I'm junking (1990 Mazda 929S--nice car, too, seen better days), to hook up in my shop, so I can listen to some decent radio, instead of brain-killing Reality TV.

Finally accomplished said task, and, big big bummer, the reception of the car radio in my shop/garage is even worse than my home radios/stereos!
Yet, this *same radio*, when I used to park the car this very same garage, had great reception.

Whazzup????

And, in general, what can I do about this reception problem, since it appears that a car stereo is not the immediate solution?
I have a 100 foot tree outside, and I'm thinking of climbing it and putting some kind of antenna at the top.
If I did this, what would be the best thing to put up there, for as much reception as I can get: fm, am, TV, whatever else is oscillating up there.

What is the problem here, and in much of the NYC area?. No valleys, and I am even on a bit of a hill, about 10 mi. from Manhattan.
What are my options? Preferably simple/cheap options, but at this point, I'll try pretty much anything.

When I was a kid (in NYC), I calculated wavelengths, etc, and had antennas "cut to size" for the various FM stations I was listening to, in all kinds of orientations. Musta had about 30 antennas taped up in my room. It was hilarious, BUT I got good reception, and LOTS of stations!
Those same dipole-type antennas are near-useless here.
:(

TIA.

1674. small variable capacitors (measured in uF)? measuring capacitance?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-05 22:25:28 UTC
From: Mad Scientist Jr <usenet_daughter@yahoo.com>

Source record: 7262
Cross-posted to:
alt.music.makers.electronic,sci.electronics.basics,sci.electronics.components,rec.radio.amateur.homebrew,rec.radio.shortwave

I would like to hook up a variable capacitor to some audio circuits I
built for learning about synths and amps
(schematics are here:
http://www.geocities.com/usenet_daughter/tone_generators.htm)
http://www.runoffgroove.com/littlegem.html
http://www.runoffgroove.com/ruby.html
http://makezine.com/09/crackerboxamp/
)

because in some of these the capacitors change the pitch, tone or
other qualities.

These circuits run off a 9V battery and use capacitors with ratings
such as
220 uF
100uF,
0.1 uF,
0.01 uF
0.047 uF
so I would want variable caps in this range.
Do these exist? Online all I am seeing is ones rated in pF.

Also, assuming I find these, and get them working in the circuit, and
find a desired setting for a capacitor, how do you measure the
capacitance? I have a multimeter but have really only used it to
measure ohms.

Thanks...

They'd be HUGE. Easily as big as a fridge or a car, even a truck in the
case of 220 ΅F.

What matters is the timing, as it's timing that matters in amps and
synthesizers, except for power supplies or sample and hold circuits where
capacity is more important.

To get long timing with small capacitors, use large value resistors, and
make sure you have low leakage capacitors.

Your on the right track OK - dont give up. Car radios ARE better,
their designed to operate on crappy aerials in a noisy environment.
BUT, they are optimised for the car type aerial - wont go into the
physics. As an starting point,can you plug in a car antenna, even if
it needs getting an extension lead to get it outside and into clear
space? - the leads are available from car stereo places, come with all
the correct plugs/sockets, and (usually) some extra capacitance to
match into the car antenna.....

Let us know how you get on, its a worthwhile project....

It is funny how a car antenna is vertical, when most dipoles are horizontal.
Anyway, I have a car antenna floating around I could use.
In the meantime, I dropped two conductor wire from my top window, about 40
feet up.
THAT oughtta get some kind of signal. Unfortunately, it's mostly vertical,
would like to get some of it horizontal--assuming that would help.

Discussions off-line are pointing me to a good log-periodic antenna, on top
of a big-assed tree, rotatable.

If *that* don't work, I guess I'm just gonna have to start whistling old
tunes. :(

Yes, because the 807 is literally the 6L6 in a different 'package'.

(The 5B254/M was made in Britain as a so-called "miniature 807", but it
must be extremely rare in the USA.)

You cannot buy variable capacitors with these values, but you could make up
or purchase an arrangement of switches and fixed capacitors quite cheaply
which a) would be the next best thing and b) would directly address your
"how do you measure the capacitance" question. Commercially they are called
Capacitance Substitution Boxes or Capacitance DecadeBoxes . They're not
infinitely variable, of course, but are finitely practical!

Nice. I'm not sure that's what the OP wanted, (more likely a single
continuous control of something), but if this switched-cap box were built
to 1 nF resolution, for $40 extra or so, you can add a variable capacitor
shown on the page David linked to: http://www.stormwise.com/page3.htm

That way you can have any infinitely variable value, just not in one sweep.

Well, I intentionally didn't suggest adding a variable as a) it would
re-open the Pandora's Box of how to calibrate the thing, and, b) the
combined tolerances of the fixed components would make a nonsense of such
calibration anyway.

As the OP sounds as though he may want several capacitors to be
simultaneously variable his best homebrew move may be to build up
a number of simple, two or three decade BCD-style, successive approximation
systems. Each will need 4 switches and capacitor combos (15 caps of one
value) per decade - a nice little homebrew project.

Initially, I didn't assume the OP wanted a large variable capacitor at all, but was mistakenly trying to match fixed sizes with variable sizes without considering why such things are not common practise. Calibration aside, the variable I suggested adding IS a viable idea, assuming your switched-cap box is valid. After all, if you CAN get any value, then you set it as you need. If it's tuning frequency, you measure the frequency.

But as I said WAy early in the thread, first reply, if you really want a sweep of possible timing values, just use a fixed cap and a variable pot, as standard. The OP was talking about synthesizers, after all, he mentioned them explicitly.

Another thing: That variable cap on the page David (and I) linked to, is more than 1 nF. So long as the fixed caps had a tolerance tight enough, it should cover (1.398 nF allows for greater than 20% tolerance on nominal 1 nF increments). Not that any of this matters, in practise.

Very simple: there isn't much market for high-quality home radio
receivers for a few decades now. With products not being sold by
quality but by how many features they have (look at a DVD player
remote control: more than 100 buttons!!!!) this is not surprising.

Car radios antenna systems are matched to the radios. Take a car
antenna, put it on a big piece of sheet metal (aka "virtual car"), and
cable it up to the radio with a correct length of cable (cable
capacitance comes into the matching at least for AM) and you'll do
fine. With some matching circuitry you could match up to the dipoles
etc. you want to build.

If your garage/shop has a metal roof it will be a fine "virtual car"
ground.

Tim.

Subject: Re: motherboard LED connectors and posts?

I think you might be looking for something that was called "daisy
chain
jumper wire" way back in my wire-wrap days. It came as a spool of
flexible, stranded insulated wire about 24 guage or so, with an
insulated single pin socket every 5 inches or so. You just counted
off
the number of jumpers you wanted to interconnect, and snip them off of
the roll. The sockets fit over standard .025" square posts quite
nicely
and allowed testing minor modifications without wrapping on new wires.

They had a multitude of uses. I still have some leds and other things
with single 5" wires attached to each leg (each with it's own socket
at
the end).

I haven't even looked for this stuff for years, and know I hava a half
roll tucked away in a box somewhere. If I could only find it I'd at
least have a part number and manufacturer to provide. I'll see if I
can
dig it out sometime in the next couple of days...

Good Luck

This would be a way to make certain components (such as pots &
trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and
play" for various prototypes + experiments. The motherboard size
headers are small enough where the leads match the components I'm
using and the pins on a motherboard that LEDs plug into are just the
right size to plug into a solderless breadboard, but are more durable
than the regular breadboard jumper wires.

And...while building that "virtual car" for the antenna ground-plane,
don't forget to make a car body sized box with upholstery type sound
absorption and place your chair in the center of this virtual speaker
box. You may be surprised at how good that simple car radio will
sound with you inside the speaker box.

I am looking for a way to make certain components (such as pots & trimmers, 1/4" phono jacks, switches, or other sub-circuits) "plug and play" for various prototypes + experiments. Similar to the breadboard concept but more permanent. Headers like those found on computer motherboards for connecting power LEDs are small enough where the leads match the components I'm using and the pins on the motherboard are just the right size to plug into a solderless breadboard, but are more durable than breadboard jumper wires.

Rick suggested "daisy chain jumper wire" (see below for a description) and I did some searching on various sites, but no luck. Can anyone say what else this might be listed under or where it might be found?

Thanks...

Ah, yes, the connectors are general-purpose, and have nothing to do
with
LEDs specifically, although this is the context in which you happen to
have encountered them; therefore searching on the term "LED" is
leading
you astray.

There are literally hundreds to choose from, but here are a couple
example part numbers I pulled out of the Mouser catalog to point you
in
the right direction:

Header: Mouser 517-2312-6111tg, 3m 2312-6111tg
Socket: Mouser 517-974-01-02, 3m 929974-01-02 (board mount)

the sockets also come for crimp pin or IDC connections. I think once
you stop searching for "LED" you'll be able to find things easily.

Subject: Re: motherboard LED connectors and posts?

Male pin headers and female socket connectors with 0.1" pin
spacing. Also socket contacts (inserts) are often sold
separate from the socket itself.

They can be very expensive from electronics supply houses,
ridiculously so for the female connector and insert.

http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2342...
http://www.digikey.com/scripts/DkSearch/dksus.dll?PName?Name=609-2301...

What exactly are you looking for? Straight plastic sockets
with 0.1" pin spacing but do they have to be the very thin
(black in your links) type such that on a row of pins in a
pin header, you could plug in two right next to each other,
OR could the plastic connector body be larger like those
used on fans? The point is that if looking for an
especially low price, one option is surplus electronics
'sites which may have something that would work (or may not)
depending on the requirements beyond the basic # of pins,
spacing and pin size.

You might find them called something else, generically grouped as just "connectors" or slightly more like "pin connectors" at a store/site that doesn't deal with as many connectors and just doesn't follow standard naming practices.

You might check the following surplus sites (and ebay).

As others have mentioned, these values are not widely available in variables partly because they are unweildy, and partly because they are rarely needed.

Take a look at your circuits. Many of the capacitors are "uninteresting". For example, if you look at your "little gem" amplifier, the 100u is simply filtering the supply (looks like a little overkill), the .01 appears to be mostly DC blocking, although it is small enough it might have an efffect on bass response. Ditto for the 220. The only one that looks like it might be interesting to experiment with is the 0.047. The other circuits are similar. Capacitors have all sorts of functions in various circuits, and for many of those functions, playing with the values isn't very satisfying.

Before you go building these things and playing with them, I would suggest modeling them in some SPICE flavor or another. This would allow you to experiment with the frequency response without actually building the circuit. Once you have seen some interesting SPICE responses, *then* go buy some capacitors.

As far as measuring capacitance, you can buy meters, more commonly LC meters, and many multimeters include them. You can also make an LC oscillator, measure its frequency, then put the unknown C in parallel with the C in the oscillator, and measure the frequency again. You can then calculate the unknown C. Another way is to put the unknown C in series with a known resistor, put some RF across it, and measure the voltage drops with an RF probe. Again, a little math reveals the unknown C.

..

From his earlier question I think the sockets are important. I think he's really after a 2 pin socket (0.1" pitch) ready crimped onto leads. Perhaps double ended to connect a panel mounted LED to a 2P 0.1" pitch PCB mounted header? Not sure why he doesn't make them?

My preference was always a strip of 0.1" pitch turned pin socket pins
with ribbon cable soldered into the socket side. A little hot glue or
electrical grade silicone RTV sealent at the breadboard or PCB end and
judicious use of heatshrink at the component end provides strain releaf
if required.

Plug streight in to breadboards *WITHOUT* ruining the contacts, but
sufficently durable that the mods I did to my Sinclar QL nearly 20 years
ago using this connection methor are still totally reliable in operation.

It would be even funnier to see a horizontally-polarized antenna on a car<grin>! (actually, I have one - for the 144MHz ham radio band)

Nearly all AM/MW stations use vertical transmitting antennas, not that matching polarization is particularly important in that band.

In the U.S., the vast majority of FM stations use both horizontal *and* vertical polarization (I think they call that "mixed polarization" overseas) so a vertically-polarized car antenna works just fine.

> THAT oughtta get some kind of signal. Unfortunately, it's mostly vertical,

I don't think it'll make much difference.

I believe they actually use circular polarization, so there's a 3dB loss when received by a linearly polarized antenna. Still, I'm told this is almost always a huge improvement over what you get with the transmitter and receiver both using linearly polaraized antennas.

> I don't think it'll make much difference.

I agree. In fact, as far as I've seen, unless you're running high gain point-to-point links, it doesn't seem that matching antenna polarizations on both ends matters all that much, since the fields will tends to have become randomly polarized as they propagate and reflect anyway. (Of course, I figure one of the much more experienced people here can correct me on this if need be!)

As I remember, it was from one of those "if you have to ask the price, you probably can't afford it" breadboard manufacturers. Augat, or Cambion, or the like.

Dig, Dig, Dig. Ah, no. It was Berg (part of DuPont). In an old (1994) Newark catalog I keep for reference, it's "Daisy Chain Jumpers", $215.72 for a chain of 250, either 2.5 or 5 inch spacing.

We used the same crimp terminals at a place I worked at in the '80s. The hand crimp tool cost about $900. The contact is self contained and doesn't need any plastic shell to make the contact spring action work. So the terminals can fit into a shell (like we used them), or work by themselves, insulated with shrink tubing.

But things aren't that bad, now. They use(/used?) very similar crimp terminals in the header connectors for PCs, like the plug to hook the reset button or speaker to the mother board.

Jameco sells this stuff as ".100" Non-Polarized Connector Housings and Crimp Pins". IMHO, try part 100766. Page 155 in the May 2007 catalog. 12 cents a terminal and the crimper is only $10.95. Add a little bit of wire and shrink tube. What a difference 25 years makes...

Don't know if the OP was from the UK, but UK night rates are of the
order of half the day rate (though you have to pay a higher day rate to
qualify!), but only for 7 hours. I do wonder if it would be possible
now to set up a battery/inverter/load sharing system sufficiently
cheaply to lower the cost of daytime use significantly. Probably
illegal though.

==========
Why would it be illegal storing energy ? I can't imagine that it is
illegal charging the batteries of a Golf buggy , at night tariff.
I am sure any golf club would do that to reduce their electricity bill.

BTW ,living in the UK myself ,night tariff indeed normally starts at
about 2300 hrs and finishes at 0600 hrs the following morning .
At our place switching happens with an electro-mechanical timer with a
spring mechanism such that following an outage the timer keeps running.
Eventually that spring has to be re-wound by the electricity supplier
,but that hasn't happened the past 15 years.....so the timer at our
place now comes into operation around 2320 hrs ,but then of course also
day tariff starts about half an hour later at 0620 the following morning.

No problem with a different circuit, but more so if you want to
connect to the supply. In fact people with wind etc. generators can
get permission to sell "green" electricity back to the grid
(automatic metering). It would be somehow satisfying buying night
time electricity from the suppliers and sell it back to them at a
profit.

Just to get back on topic (nearly), my meter is controlled from a
radio signal (?198kHz) which can move the 7 hours about within a
longer window.

Why would "they" wish to assassinate your character?

Well, let's put it this way - just because this is the first time it's happened in this way,
from these people, on this scale, doesn't mean that it hasn't happened before, on a lesser scale. At university there were people who quite overtly hated me and would have wished something nasty to happen to me. Because of where I went making the wrong sort of enemies is pretty deadly.

"They" would wish to assassinate my character because it had all been done before, and because they knew I would not be able to react in any other way than I'd reacted previously.

>>> ##: They invaded my home with their bugs, they repeated what I

>>> ##: our friends in ITN, last but not least our friends in Capital
>>> ##: Radio in London and on Radio 1.

Please give details of when, where and by whom these
comments were made, so that they can be checked.

This was four, five years ago... sorry, I don't remember. I can remember individual incidents,
words which were repeated by different people at different times in different locations.

Around the end of 1992 Private Eye rtan a front-cover with John and Norma Major, with the title "Major's support lowest ever" and John saying to Norma "Come back norma" on the front cover. What can you read in to that? Not a lot, seems like standard fare for PE. The first time I saw it I was in the pub with some people from work. One was expressing doubts
to the other (let's call the first one Simon, shall we? and the second one Phil?) about whether what was going on was right. Phil's answer was that if Private Eye was doing it then it must be ok, "they're usually right".

A few days later, again near work, there were some students laughing in the street, "Were you COMING BACK later? But I thought you said you were COMING BACK ha ha ha?" Play on words, you see. Not very nice, either. I had start medication soon afterwards. Clever people, these chaps who think up PE titles. Just slightly lacking in any sense of morality.

>>> ##: How did they do this? I'll give you an example. About a year ago,
>>> ##: I was listening to Chris Tarrant (Capital Radio DJ among other

What was the name of the detective agency and their
address ?

I don't see why I should tell you that, but they're in Yellow Pages; they're a well-established outfit.

>>> PM: >What? Spend a quarter mil. a year to amuse themselves? And why not
>>> PM: >change every now and again? Why keep watching you? (Unless you _are_
>>> PM: >doing something, and I don't think you are, though you may have some
>>> PM: >deep, dark secret in your past.)

>>>
>>> ##: See the above.

Is there a deep dark secret in your past ?

Apart from "it's all happened before in a different way", no.

>>> ##: In a couple of cases people have even known my name - when I was in
>>> ##: London over Easter somebody (no idea who they were, just some bloke with

>>> ##: his girlfriend) called me by name - quite clearly, and my name is
>>> ##: distinctive.

Is your name truly Mike Corley, or are you using it as
an alias ?

It's an alias. I'm not English by ethnic origin. If someone manages to pronounce
my name as well as that guy did then they must have been really trying.

>>> ##: There's a little story behind this. First of all, in 1992 I worked
>>> ##: for a company where the people made clear they knew what was going on,
>>> ##: first of all directly (the very first evening I was there I went out to
>>> ##: the pub with them and the Technical Director said to another guy,
>>> ##: "is this the bloke who's been on TV?" "yeah, I think so")

Have you appeared, or been reported by name on TV ?
When, where and by whom ?

No. Never. Not directly.

>>> ##: Also, in summer 1992 I went on a trip abroad to Europe by coach,

What was the name of the coach company and your date
of departure ?

It was a national express coach. At dover we boarded a ferry for Holland somewhere.
The company that organized the trip went out of business some time ago, so they won't
have records of passengers - so we can't get any corroboration from anyone else
that way. We tried all that last summer, ran into a brick wall.

The other thing is in summer 1992 I was visibly ill, so other people in the
party might remember that more than anyone getting at me on the coach trip.

>>> ##: >>Yes, this gets me. I think the answer is that I was set up by
>>> ##: >>someone. I was very aware when this started back in 1990 that I
>>> ##: >>was being painted as a "threat" to which people had to "react"

Why were you being painted as a "threat"; is this related
to a "deep,dark, secret" ?

Aaaarrrrgh. I think I should make clear that that's their created justification
rather than the real reason. They started harassing first and then came up with the
reasons for it.

>>>
>>> ##: I think I know who set me up.

Who ?

Someone who knew me some time ago. Someone who would have been able to talk this little campaign into existence.

>>> ##: The bloke can't even control his own mind without medicine.

Is this true ? What is the medication and dosage ?

Yes, I'm afraid so. Sulpiride, 200mg a day. It's designed to stop people coming up with the sort of ideas you've heard here for the last few weeks. Give him a higher dose!!

In the long term it causes tardive dyskinesia, tardive dementia and general nasty stuff to your brain. So it's three years of sulpiride talking to you here.

Only on VERY LARGE wind farms. Most small sites rectify the wild AC
and use syncronous inverters to feed back into the grid.

==========
Domestic wind energy systems in the 1-10 kW range often involve an AC generator ,its output being rectified with the DC fed into an inverter which is synchronised with the grid.

In the UK a company 'Windsave' sells and (obligatory) installs 1 kW wind generators which are connected to the domestic 230V-50 Hz system .
The location of the windgen and its nearby inverter cannot be too far away from the switchboard (up to 15 metres). Apparently the output voltage of the inverter is slightly higher than the grid supply , such there is a preferential pick-off from the wind gen system.
However when no power is consumed wind generated energy is fed into the grid.
I have 'heard' that in some countries (but not in the UK) electro-mechanical kiloWattHour meters can rotate reversed when fed with power from the consumer's side, with the counter counting down .
This would be very beneficial for people with the above described system . Perhaps someone on this NG can confirm that these meters really exist and in which countries.

For my AR operations + desk lighting and peripherals I use 12 V batteries charged by an up to 170 Watts windgen and 2 solar panels with a total capacity of 128 Watts(peak).....just for the h*ll of it.
The wind gen. has a 3 phase generator and integral rectifying diodes(in fact 2 bridge rectifiers of which 1 is fully utilised and the other one only half)

Quick note-had to finally give up on the single turn of antenna wire through the tuning toroid idea due to such severe signal degredation. Went back to directly connecting the tank circuit to the antenna input. Am still open to new ideas though, and seek any further input from the group.

Thanks,

Dave

Hi Frank and all,

> I have 'heard' that in some countries (but not in the UK)
> electro-mechanical kiloWattHour meters can rotate reversed when fed
I have never seen a reversible mechanical kWh meter and also never heared of this, except running reverse due to incorrect wiring.

In our current home (IJmuiden, NL) we have an electronic 3-phase meter with two counters for peak and off-peak. This meter also has a T3 to measure energy supplied back into the net, though that requires a special contract. It's a single LCD showing the counters sequentially.
I know the previously used electro mechanical meter in this house was switched by a 230Vac signal on an extra wire in the mains cable. I'm prety sure there are two 1.5 or 2.5 qmm wires with the four 6 or maybe 4 qmm wires in the cable.
There still is an old boiler relay on the meter board controlled from the same signal.
The new electronic meter might be frequency controlled.

In the previous home we did have an electro mechanical two-tarif meter and I think that one was switched from an electronic unit that I presume was a frequency selective relay.

The meter back in Newbury was just the standard single phase, single counter type.

I would expect that all modern wind turbines use rectifiers direct on the generator and then have DC power fed to one or more inverters in the base of the mast.
The inverters are synchronised to the grid before switching the generator on the net.
This is as I remember from college and as I read in the technical description of the wind turbine on which PI3WAD is installed.

Jim,

I have a PK-3 Keyer I got from Jackon Harbor Press as kit to use in a 10 Meter Beacon. But I ended up using a KID Beacon ID controller for the beacon instead. The PK-3 is a iambic keyer with 2 memories plus callsign memory, side-tone, auto CQ, beacon, A/B modes, 5-39 WPM, low current, Tick compatable. It uses a 12CE674 PIC keyer chip. I built and wired the PC board but never installed the PIC chip. I paid $19.95 plus shipping for it. I've never used it and am not going to. If you are interested in it I'll ship to you for $15.00. That's $10 for the keyer and $5 to cover the cost of shipping USPS Priority Mail.

The Pic-El route is possibly the best as the DDS board is a removable
item and can be built into a dedicated controller after establishing
which version of the software is the best for your application.
It also enables you to 'play' with PIC controller programming, you
might even write your own software for the project :-)

Hi All

Idea
IF amp. 9MHz - single ad600 working in sequential mode, AGC realized with AD8307 and opamp (http://www.mydarc.de/dc4ku/S_Meter.pdf - bild1)
control voltage for AGC realized with TL431 similar to cdg2000.

Problems
1. - find a simplest way to implement a manual IF control. ("manual" does NOT mean turning off AGC but possibility to change amplification)

How? Change a control voltage? add a manual regulated stage??? How to realize threshold?

2. How to changing a time constant of AGC

Any directions or ideas? (www?)

Hi MAc,

Can you give more examples of what you mean by "manual IF control", I
don't understand what you want to do.

Do you want to:
- Adjust overall dynamic range ?
- Adjust centre frequency ?
- Keep current dynamic range, but apply an offset ?
- etc

Do you have an English translation of your paper ? it looks most
interesting.

Regards,

Mark

Hi Mark.
I haven't English translations, only German text

> Can you give more examples of what you mean by "manual IF control", I
> don't understand what you want to do.

:-) What do I want, hmm
1. Realize and adjust threshold - You see, that it is simple detector
wirhout threshold
2. Adjust time constant of AGC
3. KNOW how to realize IF GAIN (any way) - I dont know what is the best
way - may be offset, may be additional stage, may be czanging the
dynamic range - I am just seeking informations.
What ist the way used in commertial gear? - AGC is stilll working but
amplification can be changed.

Best
MAc

PS I have also an article from FunkAmateur Januar 2005. If you want I
can send you.

1721. Re: AGC problem - ad600/ad8307

Hi MAc,

Take a look at the AD8367 variable gain amplifier. Watch out for the
input impedence of 200 ohms. Should be easy to match to 50 ohms using
a 2:1 bifilar tranformer.

Is that the sort of device that you are looking for ?

Regards,

Mark

PS Thanks for the offer of the article, is it in English ?

> Take a look at the AD8367 variable gain amplifier.

Interesting, thanks

As i wrote i have an IF amplifier based on AD600. Two stages are working
in sequential mode. It is working very good.
An AGC detector with ad8307 is also workink good - but i need change my
current linear characteristic of AGC to charakteristic with threshold.
Now I can only change a slope of LINEAR characteristic - and i need to
change more parameters.

> PS Thanks for the offer of the article, is it in English ?

Sorry, It is in German too, but most important informations are in
application note of ad8307 page21 - very interesting 120dB AGC system.
Similar to used by w7zoi.

I have a quantity of NOS Military surplus items listed here before going to the BIG 'E' :

34 WATT, WW, 140 OHM 4" L x .75" DIA. --IN ORIGINAL BOXES. HAVE 100+

100K OHM POTS -NOT LINEAR (IE: 50% TURN DOES NOT GIVE 50% OF VALUE), USES A BAND OR WIRE WHICH IS SHORTED AS THE SHAFT IS TURNED. 3"L .250 SHAFT. HAVE 100+

SPRAGUE KOOLOHM 5W, 15K HAVE 30+

Will also have a few 1M + AC SWITCH, and an additional value coming.

1.5MF AT 250 VAC, HAVE 9

2 MF AT 600VDC, CD HAVE A VERY FEW

30 WATT, WW, 8K COMING

Can supply 1 to max number I have. Make offer- pay by MO, check, Pay Pal.

Advise of ur interest: heytubeguy@yahoo.com

I would firstly put a cap on the input to short out radio frequencies
to ground.
220pf from signal in to ground works well for me.
Ground the case too if its metal.

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 17th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)

1726. Online Homebrew HF Receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-14 18:19:40 UTC
From: msg <msg@_cybertheque.org_>
Message-ID: <13731j5jp79s76e@corp.supernews.com>
Source record: 7166

Greetings:

Homebrew online HF receiver located at approx. lat. 46.8,
lon. -92.1 is now accessible at:

http://www.cybertheque.org/homebrew/rcvr

Receiver controls are realtime, not transaction based, and
audio is also realtime, not delayed in an mpeg stream.
You will need voip (SIP) capability to hear the audio until I
am able to include a java rtp client in the web page.

If you do not already have a SIP service provider, a free
account may be created at:

http://www.iptel.org/service

The web pages will add features as the project develops and
the receiver controls will add capabilities beyond the basic
ones currently implemented.

Currently, there is no queuing of user access so a chat session
is provided on the main control page to permit waiting users
to coordinate their activities. Also, only one audio connection
at a time is currently implemented.

In the future multiple audio connections will be supported and
a user login procedure will be used to coordinate access.

Please email me at the address noted on the web pages for
questions and feedback.

Regards,

Michael

Thanks for asking; I have not had the opportunity to yet measure
the receiver's performance (noise figure, IMD, sensitivity, etc.)
and while the design is still evolving the current leading
particulars are:

1. Dual conversion from 1Hz to 75Mhz, with frontend passband
currently 140kHz to 30Mhz, traps for local FM RFI, 50 ohm nominal
input impedance, selectable RF amps.

2. 1st IF 55,850 kHz, 2nd IF 455 kHz, two filters ~2 kHz for SSB
and 5 kHz AM.

3. 1st LO is a programmable PLL with a wide variety of step sizes
and large dynamic range; I am using 2kHz steps and a range from
55,851 kHz to 131,068 kHz and a 16-bit resolution.

4. 2nd LO varactor tuned xtal osc. at 55,395 kHz with a >2kHz dynamic
range, 13-bit tuning resolution (1 Hz) using a 3-bit DAC to select
one of eight 10-bit segments tuned by a PWM through a 3rd order LPF
with 10Hz 3db bandwidth. The mcu handles the tuning of the
LOs to permit a continuous 1Hz resolution over the receiver's range.
Tempcos of components are yet to be analyzed but stability has been
quite good (within 1Hz/day). Auto calibration will be implemented
but for now tuning errors may be up to 30Hz and can be measured
against WWV which at this time of year at this QTH is heard
nearly continuously on 2.5, 5, 10 and often 15 MHz.

5. IF frequency counter, 20-bit, with selectable prescaling, used for
tuning centering, ersatz synch det. on AM, etc.

6. Product det. for CW/SSB, discrim. for FM (I anticipate implementing
FM as a selectable mode on 6m and above when I do the proper front
end changes). The tuning scheme currently centers BFO in the 2nd
IF passband for symmetrical SSB; I may add USB/LSB offsets.

7. RF section is fully enclosed in a tin faraday shield with a number
of bypassing schemes; some birdies are still introduced on the digital
I/O lines entering this can which I hope to squelch with properly

designed LPF.

8. Digital section is also fully enclosed in a tin shield and physically separated from the RF section. I designed it around the Intel 8096 mcu; debugging and programming is facilitated by having an HMI-200 ICE. Operating software is uploaded over an RS-232 port which also serves as the control port for the receiver. The mcu has enough resources to implement features such as ALE, digital modes, spectrum surveillance, etc. but DSP features will be offloaded to dedicated processors.

9. Audio monitor output is 8 ohm with provisions for stereo and a 5000 ohm output feeds the audio stream server.

10. Receiver and antenna are viewed as an integrated system; the antenna is a modified Marconi matched with a 9:1 impedance ratio quadrifilar-wound balun, isolated primary, to a 50 ohm coax feedline. The antenna has a good ground which has a very short lead to the balun ground in the Marconi configuration. The feedline shield is not grounded but is continuous to the receiver chassis which currently is also not grounded (this is very low noise). The feedline is enclosed in plastic pipe and buried 18 inches deep in the soil from the antenna feed to the shack further attenuating noise. The system performs well in a very hostile RFI/EMI environment; our QTH is noted for some of the worst QRN anywhere and the huge antenna farm for broadcasters and public services is on a peak very nearby and causes much grief for radios with less than excellent dynamic range/IMD and selectivity.

So far no one has tuned the receiver or made an audio connection. It is remarkably easy to hear the audio using a SIP user agent (any voip phone that permits dialing SIP URIs such as 'SIP:9202@cybertheque.org'. I had suggested 'firefly' which is what I use, but it only handles numeric URIs (so it must be registered on the callee's SIP proxy server). Instead I recommend a version of X-Lite, which I made available at:

ftp://ftp.cybertheque.org/pub/xten

This is a Windows SIP softphone which permits dialing our SIP uri from another network, .e.g. iptel.org. Please set up a free account at iptel.org, download and install X-lite, configure it for the iptel.org account, and dial the above URI to hear the audio. Access the web page to control the receiver. At some point I hope to dispense with the need for SIP dialing by including an RTP audio player applet in the web page (such a beast isn't currently available, only JMF heavyweight code which is unsuitable).

Regards,

Michael

I forgot to mention the AGC; various time constants are
selectable and signal strength is read by the ADC in the mcu
for S-meter and link-quality data.

I would like to clarify how my online interface is
different from the 'web controlled receiver' RCSweb
(N30EA) interface commonly used for Internet access,
which may make it worthwhile to take the time to
configure a SIP client to hear the audio. The
RCSweb interface posts commands from web forms to
the radio to make settings; the user fills out a
form and waits for the results to appear at the
receiver, often the user must 'reload' the web page
to see if his settings were honored. Most often
the audio is streamed using mp3 encoding and
suffers from buffering delays of many (up to 30)
seconds as well as network QoS latencies. There is
no provision for hands-on tuning as you would do
if you were physically at the receiver.

My interface provides an interactive hands-on receiver
tuning and controlling session; there are no forms to
fill out, no page refreshes required and no waiting or
latencies for settings to take effect. The audio is
streamed in real time so that you immediately hear
the results of your control of the receiver.

My thanks to those who will try this and provide some
feedback of their experiences.

Regards,

Michael

Source record: 7173

Hello,
I am designing a radio receiver and I need a narrow filter in the FI
stage,
at 10.7 MHz, in order to filter a single carrier.
Anybody could tell me where to get information about designing ladder
filters?
Thanks :)

It depends on what you need. Don't forget that the first single signal selectivity came to receivers in the thirties, via a single crystal filter. I'm suddenly blank about the name, but it was a balanced transformer feeding a crystal on one side and a trimmer capacitor on the other. You'd trim out the crystal holder's capacitance with the trimmer. Not perfect skirt, but really great selectivity. Later, variants would appear where load resistors were added to broaden the selectivity for voice.

Much later, you'd see them cascaded, to improve the skirt.

Their big benefit is that you don't have to have more than one crystal frequency, up till ladder filters started making a mark some years back, crystal filters all tended to use crystals separated in frequency by about the required bandwidth. So you'd see these cascaded filters as add-ons, and in the age of solid state, the balanced transformer was replaced with a transistor, with the collector and emitter acting as the two sides of the output winding to drive the crystal and variable capacitor.

For sloppy selectivity, there has been lots about just putting a crystal or ceramic resonator in the cathode of a tube or emitter of a transistor. I'm sure for many applications, that would work fine, and doesn't requre any fussing.

IIRC, that's what the BC-348 employed. My BC-348 has several
inspection stampings dating to circa 1938-39.

The latest ARRL handbook comes to mind. Have you web searched?

It is often profitable to choose a frequency at which you can get lots
of inexpensive crystals -- it's often cheaper to buy and sort through a
bag of 50 cheap crystals than it is to order four custom made ones,
unless you're counting the value of your time.

And if you _are_ counting the value of your time, you'll just want to
buy a crystal filter, or a whole dang radio!

$60.00 Each Midland 70-340 VHF APRS/Packet Radio [Plus Shipping]

I have a quantity of Commercial Midland 70-340 VHF Mobile Radios 25-30 Watts O/P comes with a Regular Power Connector, Mobile Mounting Bracket and a Midland 70-2301 Palm Mic (which you don't need if you are only using APRS or packet). These radios will work excellent as an APRS Mobile OR Base Radio Station. Using this radio is much cheaper to use for dedicated APRS use rather than spending Large Dollars for a VHF Amateur XCVR and dedicate it to One Channel APRS use. The radio is Programmed and Tested Operational on 144.390 Mhz.

IF you wish the Power Cable pre-wired c/w a DB-9 Male [ADD $20] > ready to plug into a Tiny Tracker APRS Unit or any External Interface < Schematic Drawing of the Interface Cable is supplied

Midland 70-340 VHF Service Manual available on CD with a Radio [ADD $10] Sold Separately [ADD $15] includes Mailing

These radios are capable of 36 Channels and comes with a CTCSS Board, should you need it. I can program them for other 2 Meter Frequencies for a charge. Please ask should you have any questions.

Thanks for looking....Norm VE3CZI

Anyone know if this is on the Web somewhere? A Google search returns a pile of Asian-language sites, one of which might have the information if only I were literate in Chinese/Japanese/Korean...

It's the logic chip in a cheap mini FM transmitter, sold for use with MP3 players. I'm trying to change the frequency selections, as none of the factory choices (88.1/88.3/88.5/88.7MHz) are usable here.

I did find a schematic for the transmitter as a whole on the FCC website but changing the logic level of a pin that *seemed* appropriate caused the unit to stop working altogether. (or shifted the frequency out of the FM BCB...)

My notes, based on a ripping into a unit I got from Wal-Mart a while back, disagree with your factory choices. According to my notes, pin 18 to Vcc selects a band which has choices of 88.7/88.9/89.1/89.3/89.5/89.7/89.9.
And pin 18 to ground selects a band which has choices of 107.7/107.9/108.1/108.3/108.5/108.7/108.9. Maybe due to this disagreement you've got some customized or different variant version of the chip. I think my chip was a BH1417-something or other (Rohm?). Is HY Hyundai or something else?

The unit I was playing with had a varicap and a small coil for tuning the VCO of the synth. I had to remove a few tunes from the coil to get it onto the 107-108Mc band as opposed to the factory 88.7-89.9Mc band. It didn't stop oscillating when the coil was out of range, but it didn't lock either.

Tim.

That's where I got my unit, but it would appear BH1417 and HY1417 are two different chips. I can't change the logic level on pin 18, because the HY1417 has only 16 pins<grin>!

My unit has another chip, six pins, that appears (both from physical inspection and the schematic) to be the actual PLL. Performs the function of the MPSA13 and pins 7-9 on the BH1417. HY is not Hyundai. I can't remember what it is & left the printouts (and the FCC ID# for the unit...) at work...

As I mentioned in the other reply, HY1417LP and BH1417 are two different devices - HY1417LP has only 16 pins but is used with a separate 6-pin chip which appears to be the VCO.

I of course managed to leave the battery cover (with the FCC ID#) at work last night so won't be able to look up the exact link until much later. I've not been having any luck looking up the FCC ID#s on various other pieces of electronics in the house. (type in the ID# exactly as it appears on the sticker - and the FCC says it doesn't exist...) But it worked with this device. On this URL:

https://gullfoss2.fcc.gov/oetcf/eas/reports/GenericSearch.cfm

you put in the ID code, look under Attachments, there may be one for a schematic. The manufacturers can mark it as confidential but in this case they didn't.

Certainly it was described first by Lamb, or he actualy came up with
it, in that famous 1930's article about improving receivers. Basically a
phasing crystal filter, which I suddenly was blank about when I posted.
I'm not sure I've ever seen it called a "Lamb filter", though perhaps
if you go far enough back in the books, it was once called that.

Actually, it wasn't. Don't recognize the famous 1930's article you refer to, but Lamb came up with the Lamb noise blanker. The principle of operation being to turn off the IF strip while the noise pulse was present, the "hole" being less noticeable and annoying than a huge noise spike. Walter Cady came up with the single crystal filter in 1922. Incorporated in most superhets during the years 1925 until the ladder, half lattice and full lattice filters came along in the 60's.

The QST article is pretty famous, and at the very least is credited
with bringing single signal selectivity to amateur radio (if not the world).
I can't find a paper reference, but it might be an article titled
something like "What's Wrong with our Present Receivers" from 1932 (though
I thought the specific article had come later), and it may be
referenced in Byron Goodman's January 1957 article of the same name.

Everyone credits the article with bringing single selectivity to
amateur radio, and I can immediately find some web references that claim
(and I've read this somewhere in the paper literature) that Millen used
many of the ideas in the article for the HRO receiver. The noise blanker

may have been described in the same article.

And of course, it was lattice and half lattice filters that came along in the fifties that allowed many to build SSB transmitters, if they couldn't afford mechanical filters and didn't want to use phasing. I never saw a reference to ladder filters (except for some oddball bit in the SSB column in the fifties that had two serial crystals and one going to ground where they joined) until the seventies, and it was more like a decade later before they became popular in hobby circles.

Jeepers. This thread is getting as long as some of Cecils threads. I hope it isn't as dumbfounding.

James Lamb, 3CEI, 1CEI and W1CEI, was tech editor for QST in the 30's. As such, unlike todays offerings, he ALWAYS had at least one technical article in each issue starting as early as March 1928. One of those articles was in June 1932 and was titled "What's wrong with our CW receivers?" That article had to do with audio selectivity and no crystal filter was mentioned. In August 1932, he published another article, "Short Wave selectivity to match present conditions". This was amateur radios first published introduction to the single signal crystal filter

In this latter article, Lamb acknowledges the pioneering work of Cady in a footnote, who published his discovery and design of the single signal crystal filter in the Proceedings of the IRE over 10 years earlier in April 1922. Lamb only repeated Cadys work in QST. He may have brought it to the amateur fraternity, but the world knew of it from the Proc of the IRE some 10 years earlier.

Lamb WAS responsible for the invention of the "Lamb noise silencer" which bears his name some years later.

There is a guy in Dover Pa. named Charles Byers and he custom
builds chassis any size you want. He is a ham although I forget
his callsign. I do know he lives on Harmony Grove Road however.
Look him up.

Source record: 7195

Hello,

I am working on micropower 433,92MHz battery powered receiver and have a problem with LNA. I have tried a few configurations (including cascode) but I cannot lower current consumption below 400 uA. It is too much for me. I don't need high gain because this LNA is to be a buffer only but device price should be as low as possible. Have you any idea how to lower the current? I don't need exact project but some advice.

Greetings
Leopard

Hi Leopard,

What is your DC power budget, signal gain, NF etc ?

- Volts, DC
- Current, DC
- Gain, dB
- Noise Figure, dB

Might it be acceptable to switch on the LNA occasionally, but have it
sleep for 90% of the time ?

-Mark

Please note that if you are running the LNA or mixer at very low
current, the strong signal handling will be very poor from signals at
the frequency or nearby frequencies. If you are going to run the LNA
or mixer at very low currents, I would strongly suggest that you put a
very narrow filter centered at 432,920 MHz in front of the LNA,
unfortunately the filter losses will degrade your system noise figure.

Can your design live with fewer MIPS and a lower sample rate (downconvert the IF)? I'm working on a design using a old DSP sound card which will talk to my mcu in the radio; the card has a TSM320 DSP, a great (free) toolchain, lots of sample code, and no need to fab a pcb. Of course its resources are an order of magnitude less than you've specified but it will still do filtering and demodulation.

If this approach is of any use, I'll send you the toolchain and docs ;)

Regards,

Michael

1. I generally do this by prototyping the algorithms using Scilab, or designing them on paper, then figuring out the number of operations (for MIPS) and data storage requirements. You'll probably find that the FM demodulation takes the most processor time, unless you're decoding multiple SSB channels for some odd reason.

2. I make a conscious effort to not fall in love with any particular processor. Look at a few different choices in your target word size and data type, and try to get a feel for how much time it'll take to run your algorithms.

1 & 2. _Don't_ forget the 'regular processor' stuff when you're sizing memory and processor bandwidth! Wouldn't you feel silly if you had 20 times the RAM you needed for your DSP, but didn't have the buffer space

necessary for your TCP/IP stack, or if your algorithm took up 500 words of memory but you ran out of space for menu lines in ROM? Generally with these mixed-target DSP projects you can expect 1% of the code to take 95% of the consumed processing power; you need to make sure you have the code space for the other stuff.

Hi Mark

> What is your DC power budget, signal gain, NF etc ?

> - Volts, DC
3V

> - Current, DC
as low as possible, battery 300mAh should work minimum 1 year. Maximum
average current should be less 30uA. I wonder if this is feasible at
all?

> - Gain, dB
2-3dB quite enough. My receiver is superregenerrative device and it's
sensivity is good but I have to add buffer to fulfill European RTTE
norms.

> - Noise Figure, dB
This is a short range communication max 100m, transmitter has about
1mW power so the NF is less important than current consumption.

> Might it be acceptable to switch on the LNA occasionally, but have it
> sleep for 90% of the time ?
I thought about that. I have found such a project on EDN site. The
current consuption of the whole receiver is about 200uA but it is
still to much.

I am way behind you guys on the DSP-SDR subject but I appreciate every
scrap of information you share.

I am currently trying to puzzle out the strategy used in acquiring
data from a sound card.

I have successfully built the Softrock Lite 40 meter receiver and am
ever so slowly working on a Softrock RXTX Ver 6.2 40 M transceiver.

* It depends
* The barebone DSP functionality will take about 20...30 kbytes of the
program memory and several kbytes of the data memory.
* For the single channel processing, the workload should not exceed
about 100 MIPS.

> 2) Anyone have a specific DSP they favored for
> this type of application?

It doesn't matter. Whatever DSP you wil take, you will be screwed many
times.

The general purpose stuff can easily boost the program size over the DSP internal memories.

I'm willing to accept some tradeoffs for the sake
of simplifying the design (i.e. the AD9874 integrates
an ADC and digital filter which is convenient though
less flexible then a ADC coupled with a FPGA).

> however the performance of the classic analog
> receiver of the communication class is much better.

That seems to imply some type of fundamental limitation
exists with using the AD9874. Care to be more specific?
For example the AD9874 spec claim 95 dB dynamic range,
there are certainly radios which claim a higher dynamic
range. However I'm imagining that a 95 dB dynamic range
should work for a lot of signals.

I am not familiar with that specific component, but does it really contain a decent S&H circuit for decimation ?

Even with a proper S&H (ten nanosecond sampling and several microsecond hold times) for decimation, the 280 Ksamples/s sounds a bit low for FM broadcast detection. The higher order (Bessel function) sidebands are still quite strong with the modulation indexes used, so truncating the bandwidth to the 100-140 kHz range might not be a good idea.

If you after all want to include broadcast FM reception, I would suggest that you do the reception in analog way and only go to digital after the ratio detector, when 150 kHz sampling rate might be sufficient for stereo and RDS separation.

For the other modulation modes, I would suggest using a high 1st IF (40-80 MHz) with a proper roofing filter combined with a few IF stages and AGC. This signal might then be decimated directly (or after converting to 455 kHz for steeper filters) and processed at sampling rates well below 100 Ksamples/s.

With the roofing filter and the AGC in the first IF, the ADC should be able to handle large signal variations, as long as the offending signal is not within the roofing filter bandwidth.

The IF passband of an FM receiver needs to be at least 200 KHz for good quality and -- counterintuitive to me -- I'm told that the capture ratio improves as the bandwidth increases. Back in the 50s, one premium receiver -- the first I knew of to use semiconductor diodes in the detector -- had a half-MHz IF.

The IF is 1.7 MHz which is sampled using a 13.6 MHz clock by the
AD9874
and decimated by a factor of 48 to produce the 280 Ksamples/s output.

Looking at:

http://en.wikipedia.org/wiki/Fm_broadcasting

I see that FM audio goes from 0 to 53 KHz and RDS is at 57 KHz.
The AD9874 decimation filter should prevent any signal from aliasing
into the bandwidth of interest and the resulting sample rate is
above Nyquist.

I'm missing something ... assuming no aliasing problems why is
a higher sampling rate necessary for recovering the audio and RDS?

Assuming cochannel signals with small power difference, as the BW
increases the weaker
one will hit threshold (knee in the SNRout vs SNRin curve) first. Does
that explain it?

You're looking at the audio baseband bandwidth, i.e., the signal after being FM demodulated. From your description the signal you're getting has not yet been FM-demodulated. Thus you need to account for the +/- 75 kHz peak deviation of the FM signal, at a minimum. If you can swallow up the whole 200 kHz, you gain slightly better performance due to the admission of more the bessel function sidebands, as others have noted.

I think that there is more to this story...

In his book 'Piezoelectricity' (originally published by McGraw-Hill in 1946; 2nd revised ed. Dover, 1964) Walter Cady indicated that he first proposed the idea of using a crystal in a filter in 1921. He referred to his Proc. IRE article, and his patent US1450246, filed Jan 28 1920, granted April 23 1923. As far as I can see, the configurations proposed by Cady do not include the center tapped transformer circuit used by Lamb.

Cady went on (2nd ed, p 668): "Filters employing crystals were first described by L. Espenchied". There is a reference to patent US1795204, inventor Lloyd Espenschied of A.T.&T., granted Mar 3, 1931, filed Jan 3, 1927. This showed the use of crystals in a ladder structure.

Other work was also taking place at the same time. Robert Kinsman, in his paper:
'A History of Crystal Filters, 1988 IEEE Frequency Control Symposium,
pp 563-570,
provides some pointers. He refers to Cady's paper and Espenchied's patent, and also a patent US2005083, inventor Clarence Hansell of RCA, granted June 18, 1935, filed July 7, 1927. This shows the single crystal filter in the center-tapped transformer configuration with the capacitor to balance out the crystal shunt capacitance.

Kinsman does not mention a further patent: US1994658, inventor Warren Marrison of Bell Labs, granted Mar 19 1935, filed June 7 1927. This too shows the a single crystal filter with a center-tapped transformer configuration.

To me, the fact that it took nearly 8 years for these patents to be granted suggests that there were some major issues to be resolved.

There were also developments in the UK as described in the ''Amateur Radio Handbook', 2nd ed., RSGB, 1940, pp 70- . I think that this chapter was probably written by Ernest Gardiner, G6GR, who did much to bring the use of crystal filters to the attention of UK amateurs in the 1930's. According to the book, Dr. James Robinson, while looking for a sharply peaked device to test his Stenode theory of reception, intoduced the quartz crystal resonator into radio circuits. The book goes on to say that Robinson publicised his work in the USA during a lecture tour in 1930, and its potential use in amateur radio was first recognised by American engineers and amateurs. The book then goes on: "The excellent work of James Lamb in developing the practical applications of the circuit is well known...". The folk lore in the UK is that Robinson introduced the center-tapped transformer circuit to Lamb.

Robinson was granted at least four US patents for his work, ie US1821032, US1821033, US1898895 and US1908558. All four patents were filed between 1929 and 1930, and all four show some form of a center-tapped transformer crystal filter circuit. US1898895 is entirely concerned with a specific embodiment. It was filed on June 9 1930,

but not granted until Feb 21 1933.

Two other points are worth noting:

1 Cady's book contains many references on the use of crystal filters in receiving sets. There are five to acticles in by Lamb in QST, in Aug 1932, Nov 1933, May 1935, Apr 1937 and June 1937. There is reference to an article by Robinson on Stenode reception in Radio News in 1931, pp590ff.

2. The filters invented by Espenschied were of too low a bandwidth for voice use at a carrier frerquency of 60kHz. Warren Mason found a solution in 1929 using a full lattice filter. To quote Kinsman: "Mason expanded on this work in a landmark paper published in 1934." and "... which was the basis for all crystal filter designs generated in the next 20 years." The paper, 'Electric Wave Filters Employing Quartz Crystals as Elements', was published in the Bell System Technical Journal, Vol 13, July 1934.

Thank you for the expansion. I have Kinsman, his work on monolithics alone
are worth the price of the book.

I've got a few of them. First of all, I've got:

450kHz CF @6kHz bandwidth Z=20k
These units were used in the Collins 674/U, and later versions of the 651S-1
after the 2nd I.F. was switched.
75 dollars each, plus shipping.....new old stock

455kHz USB/LSB pair.
I believe that this is the filter set for the Racal 6790 series
100 dollars for the pair, plus shipping

455kHz CF @ 6kHz bandwidth Z= 50 Ohms
These were special units for Collins Radio equipment. Good for that single
conversion receiver project
75 dollars each, plus shipping

Pete

Using C++, it's not that hard. This page of my website,
http://sdeyoreo.tripod.com/id5.html gives the steps and code to
capture sound and fill an array with the samples from the soundcard.
Fell free to ask me more if you want.

Can you use one of the blackfin stamp boards ?
http://blackfin.uclinux.org/gf/project/stamp

Digikey sells the BF537 stamp board for US$226
http://www.digikey.com/scripts/DkSearch/dksus.dll?Detail?Ref=141450&Row=440505&Site=US

http://www.analog.com/en/prod/0,2877,BF537%252DSTAMP,00.html

Could always try and make a network interface for controlling the radio.

I'm just starting to look at what I need for getting a similar set up but
A.M
and ssb only for students to use in a lab to introduce them to the bascs of

sdr.

The lecturers want the students to program different modules ,
different types of modulation , encoding and decoding, set different
sampling rates etc They want the students to be able use both c and matlab.

Looks like we'll be using a c6713 dsk as the base
(thanks to TI providing free software)
I just get to assemble/build/integrate what gets specified.

Someone in the faculty has a couple of lyrtech signalwave boards
which they aren't using(been sitting in their filling cabinet for a few
years), have to see if we can prise them off them.
Then see what it costs to get support (need the up to date software).
http://www.lyrtech.com/DSP-development/dsp_fpga/signalwave.php

With 1.7 MHz IF you are going to have to construct your own LC band pass filters in front of the AD9874, if 1.7 MHz is the first IF.

If this is the second IF and you have proper filtering (ceramic or crystal) at the first IF, say 10.7 MHz, a very simple filter at 1.7 MHz should be sufficient. Due to not so spectacular performance of that chip, I would suggest using a selectable IF filter at 10,7 MHz (or whatever the first IF is), to even roughly match the required bandwidth of the transmission.

If the IF filter would be 110-280 kHz wide to allow broadcast FM reception, using such receiver in Europe to receive the 7.0-7.1 MHz amateur band when there are very high power international broadcasters starting at 7.1 MHz, might give quite disappointing results, since those strong broadcast signals would control the AGC reducing sensitivity and you still would get a lot of intermodulation products.

It also appears that the quoted dynamic range applies only to certain AGC settings.

The use of 1.7 MHz IF with a very wide input filter may be problematic at least in countries that are still using the AM broadcast band actively, with very strong signals up to 1.6 MHz. On the other hand, local 1.8 MHz amateur radio signals may be quite strong. In any superheterodyne receiver, there is always a risk for signal break-through from the environment to the IF stage at that frequency range. For this reason, common IF frequencies, such as 10.7 MHz and 455 kHz, are usually excluded from transmitter frequency assignments.

>Looking at:
>
> http://en.wikipedia.org/wiki/Fm_broadcasting
>
>I see that FM audio goes from 0 to 53 KHz and RDS is at 57 KHz.

While the modulation index for the RDS signal is quite low, thus producing only the first order Bessel sidebands at +/- 57 kHz from the carrier, the stereo difference signal S can have a quite high modulation index, thus producing the first pair of Bessel sidebands below +/-53 kHz from the carrier but also producing some significant

second order Bessel sidebands below +/-106 kHz and possibly even the third order at +/-159 kHz.

Of course, this requires that there is a strong high pitch tone only in one audio channel to get a huge difference signal.

Is there someone with experience as like that during ECHOLINK
operation?

NO BANANAS - NO APPLES - just ping games.....

Never ending test pings ghosting through the Internet since 2006 what
we recorded and looged.

What's behind that tactics and abuse strategy?

With blocking of DHCP PORT 67 and 68 the ghosting and ping knocking
are over.

What's are the PRACTICAL reasons for that phenomenon and tracking
control - TOT net in Thailand and ABUSE from US via DHCP and ICMP Echo
Port 8?

1780. good source to buy very small tin boxes/containers?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-27 14:14:03 UTC
From: Mad Scientist Jr <usenet_daughter@yahoo.com>
Message-ID: <1182953643.801182.310670@u2g2000hsc.googlegroups.com>

Over the years I have found random tins (some square with hinges, some round) are great to use for project boxes. Especially for very small circuits (ie preamps) that need RF shielding.

Can anyone recommend a good vendor of small tins? Buying them at the supermarket gets expensive, and I hate wasting mints (I already have too many! my teeth can't take anymore!). For my current project even a box half the size of an Altoids box would be too big (I am currently looking for something the size of a matchbox, or round ones as big around as a quarter and about 1/3" deep).

Any recommendations would be much appreciated!

Go visit your local gunshop. In particular, the ones that cater to the black powder folks. The primers for a muzzle loader come in exactly your description of the "round one". After they've used the primers up, they're thrown away. Might visit a compounding pharmacy as well. A lot of medication salves come that way too, the pharmacist no doubt has empties after compounding some medication or other or perhaps even has empties that he stocks to supply customers with some of his products.

There's good reason to modularize, but this is getting close to too much modularization.

1782. Unlock in cw in the TS-140

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-27 17:57:59 UTC
From: fazamy <fazamy@aol.com>
Message-ID: <1182967079.277616.74200@q75g2000hsh.googlegroups.com>
Source record: 7222

I turned on the rig and was tuning around. Everything seemed to be working, and a few minutes later the audio ceased and "unlock" was sounded in cw and the display panel quit showing the frequency and showed 7 dots instead. Each time I touch the tuning knob the same thing happens. I have the Instruction Manual that says nothing about this condiition. Has anyone had to fix this sitiuation? The sole modification I have on this rig is an interface so I can have a log.

As with many small project enclosures, the market is crazy
such that you can get it as a container for a product,
cheaper than if the container IS the product.

I think you'll find buying empty tins is more expensive
unless you bought them by the pallet. Possible alternatives
in the tiny size you want include pill tins or gum tins. I
haven't seen any pill tins like this for years (but then I
hadn't been looking for them) but the candy isle at your
local stores are probably still the best bet (if not at the
checkout / cash register lanes.

A cheap pocket watch that doesn't work. Toss the guts, and you have a
nice case. Fools the eye, as the French say.

Al

I make small (and even medium-to-large) cases of arbitrary
sizes out of various widths of aluminum "U-channel" for the
sides and flat pieces of aluminum (or ABS textured plastic, etc.)
for the "top" and "bottom". For rather small sizes, both the
channel and the flat pieces are stock items at larger R/C
hobby / model stores.

Sounds like the exact symptoms my TS-940 had and it turned out to be the
well known PLL unlock problem.
There are many pages of info via google search, might be same for the
TS-140, might not

1787. ? on feedthrough caps

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-27 22:26:32 UTC
From: Dave <db5151@hotmail.com>
Message-ID: <1385p0u1379t62f@corp.supernews.com>
Source record: 7227

Can someone tell me what a feedthrough capacitor actually does? One source says it passes DC or low frequency signal through a panel, and another says it passes any signal through said panel. Are they nothing more than a feed-through device with a small amount of capacitive reactance? My Encyclopedia of Electronics leaves me hanging on this one...

Thanks for any help,

Dave

1788. Scanner that would be a good spectrum analyzer?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-27 22:39:20 UTC
From: Joerg <notthisjoergsch@removethispacbell.net>
Message-ID: <2FBgi.22698$C96.8583@newssvr23.news.prodigy.net>
Source record: 7228

Hello Folks,

Sorry but I am not familiar anymore with what's out there today and searches at the major manufacturers left me a bit confused. Sure, receivers like the R8500 have a computer interface but there is no info how fast it is etc.

So, is there a scanner that can be used as a simple spectrum analyzer? Mostly to find EMI sources, no need for a tracking generator.

It should be free of relays for the band filters. I've used a JRC receiver for conducted EMI and the relays are now pretty worn. So is the encoder shaft bearing because it can't be PC controlled. Not good. It should be reasonably fast so you can thoroughly scan across a few hundred MHz in tens of seconds, not minutes. Ideally USB, no idea why many current radios still use RS232. And yes, it can be a "receiver on a card" if it has to be. The only one I found is Winradio but the web site only says "register your interest", no pricing. That makes it appear as if there may not be an actual product but I am not sure.

A good feedthrough capacitor is arranged so that the capacitor part has very low parasitic inductance and resistance between the center fed-through conductor and the case. The case may be intended to be soldered to a shield can, or may have threads so it can be mounted using a nut (or perhaps into a tapped hole in the shield can). They are used to get relatively low frequency signals into and out of shielded areas, most commonly. You can get them in various capacitance values. 1000pF is common, for example. Overall circuit design will determine what frequency range can be passed. For example, 1000pF driven by a 1 ohm source impedance will have a -3dB corner frequency of about 160MHz, but driven from a source impedance of 1000 ohms, it will be a 160kHz corner frequency. It's pretty common to use them in conjunction with a series inductance or ferrite bead on one or both sides, very close to the feedthrough, so that RF isn't picked up by the lead and fed through because the impedance is too low--the inductance or bead guarantees a reasonably high impedance at RF frequencies. You can also get feedthroughs that have not only shunt capacitance, but also series inductance or built-in ferrite. (Note that the ferrite provides some inductance at moderate frequencies, but at higher frequencies--up to a point--the series impedance becomes mainly resistive. That helps damp resonances. See curves of impedance versus frequency for parts found on the TDK website, for example.)

Hope that helps...

Cheers,
Tom

Wow. Thank you Tom. Lots more than I found with Google... It is much appreciated.

Best regards...

Dave

1792. Novel source for copper antenna wire

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-28 03:27:12 UTC
From: msg <msg@_cybertheque.org_>
Message-ID: <1386afdnmde38f8@corp.supernews.com>
Source record: 7232

Greetings:

Today, while perusing the wares at a local marine outfitting
store, I came upon 300 foot reels of 20ga. 7-strand copper
wire intended for use as "fishing cable". The price is
roughly 6.7 cents/foot and the sample I was given appeared
to be no different from wire sold for electrical purposes
except for the very tight twist and strong tensile strength.
To me it looks like great antenna wire at a good price
in view of the copper bubble. I don't have a milliohmmeter
so I cannot conduct conductivity tests other than to say
that a few inches of it zeros a DMM.

Has anyone used this material?

Regards,

Michael

No. But if it's for shortwave, in my early days I have used all kinds of wire. Including some kind of clothesline with a galvanized core and it all worked fine. The only thing that got hot and occasionally exploded were the baluns.

If you need to lower the corner frequency Tom mentioned you can solder a 0603 chip capacitor in the range of 0.01uF to 0.1uF from feedthrough pin to the can on either or both sides. I always have a whole can of those at hand, like the salt in a kitchen.

You could probably twist some of the FM/IF detectors into doing that.
Many of them have RSSI outputs that go as the log of the signal
strength, I've seen literature that suggests you can block the DC from
that and feed an exponential stage to get AM detection with built-in
AGC. For SSB, if you switched out the quadrature filter for FM
detection and injected a BFO into the appropriate pin you could get SSB.

But if you're playing around with a board the size of a playing card,
why not build three optimized detectors, or get ambitious and slap down
a DSP with appropriate ADC and DAC resources?

But be careful with a DSP in a receiver. They require a clock and
generate all kinds of RF noises. Might have to be in a can.

Of course, a DSP can do all sorts of other stuff like DRM. Although I
doubt DRM will ever make it into the market.

This old dog would have to learn some new tricks to implement DSP. I thought
I remembered seeing a chip somewhere that did SSb AM and FM.

Tim's right there is enough room for three descrete detectors. I can easily
squeeze it all in if I redsign the board, Maybe a PLL circuit for FM unless
someone can suggest something more modern. Probably a special purpose chip
available that I am not familar with. I wanted to adFM so I could use the rx
with VHF/UHF converter. IF is 455Khz.

Jimmie

Once you've gone to a PLL, you're mostly there. Add a bit of phase shift
network (the old analog Signetics PLLs always seemed to get away with a bare
minimum), and a product detector, and you've got your AM detector. Then
you've got your product detector, so all you need is a crystal oscillator
for a stable BFO.

Some are pretty brazen. AFAIK the Winradio goes from a 1st IF of around
109MHz straight down to around 15kHz. No idea how good that works, could
not find anyone who has it.

Hello all of you,
During the last field day some members of our club ask if it is
possible to connect to the main station two headsets and a speaker at
the same time. Each headset should have his own control of volume. The
volume of the speaker will be control by the vol of the radio. We
would prefer to use only passives components (no transistors, no power
supply only transfo and/or potentiometer.)
Just point me to the URL that will be ok

Happy day,
73 de Jean (VE2GHI)

PS:. Hope you had a great field day

I found "hard drawn" copper wire used for safety and ground on suspended
chandeliers also works great. It's about the same cost but comes in may
gages.

Pads are commonly used to control volume at the jack in audio distribution arrangements; I also use headphones which contain a built-in pad for volume (a slider mounted in one of the earpieces). In the U.S., Radio Shack used to be a source however I cannot find any at their website.

Use a pad that maintains a nearly constant input impedance to audio across its adjustment range; the bridged-T pad has both constant input and output impedance. Make sure the total parallel impedance of the connected pads matches your audio distribution impedance, (say 600 ohms); use a transformer to match the audio output impedance of your radios' speaker jack (say 8 ohms).

Consider controlling the radio's speaker with a pad as well so that the line level remains unaffected by local volume settings.

A site describing pad construction and theory is at:

http://www.uneeda-audio.com/pads/

Michael

1809. RF newbie has a ? RE: Armstrong oscillator in Q multiplier for receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-30 21:14:37 UTC
From: Dave <db5151@hotmail.com>
Message-ID: <138dhu68k978ifa@corp.supernews.com>
Source record: 7050

I have built a homebrew MFJ-1020A (tunable active antenna) which works reasonable well, but am not satisfied. I am wanting to incorporate a Q multiplier in it for the purpose of narrowing bandwidth of the received signal, as well as increasing sensitivity so I can pick up weak stations better (like Voice of Korea, which for me is right on the edge of intelligability). The circuit I am working with uses an Armstrong Oscillator set to *almost* begin oscillation, with its inductor being a loop in parrallel with the loop antenna I have hooked up to the 1020A, as well another coil of wire which feeds the preamplifier in the 1020A. My loop antenna has four turns of about eight inches diameter, and I have enough wire for the preamp pickup to have 25 or 26 coils, but am not sure how to construct the single coil used for the Armstrong Oscillator. Should I have a single coil parrallel with all the rest (both tuner and preamp pickup) or should I wrap wire around the other two sets of coils, toroid-style, and make that the coil for the Armstrong Oscillator? And should I use very thick wire (like 10 guage multi-strand) or something thinner (like 24 guage single strand)?

I really have no idea which approach would be more effective for the Armstrong Oscillator, and would be grateful for any input the group has. Just for the record, the Q-multiplier I am trying to incorporate is taken from Joe Carr's Practical Antenna Handbook, and is also in his book called Antenna Toolkit.

Again, any help would be appreciated. I really am (obviously) an RF newbie.

Many thanks.

Dave

Anybody remember back in the "old days" using a super-regen receiver?
Centering the signal in the passband gave AM, tuning off to the side one
could slope-detect for FM and if the regen control was set high enough to
make the detector break into oscillation, (in essence, inserting a BFO) one

could then detect CW/SB signals.

Just reminiscing,

-NM

1811. IF Freq for SDR sampling

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-06-30 23:57:19 UTC
From: john@feith.com
Message-ID: <1183247839.107455.144150@k29g2000hsd.googlegroups.com>
Source record: 7052
Cross-posted to: rec.radio.amateur.homebrew,comp.dsp

I'm trying to get an idea of some of the tradeoffs involved in
determining
where to perform the analog to digital conversion for a SDR design
which
uses 200 MHz as the first IF (pick due to SAW filter availability and
it's
high enough to simplify the front end filter bank ... the receiver is
a
homebrew type intended to cover .5 - 600 MHz with a maximum signal
bandwidth of 200 kHz).

Some options:

1) Sample at the first IF using subsampling.

Advantages: Eliminates the need for an additional LO and mixer.

Disadvatages: Brad Evans points out in a comp.dsp article entitled
"Undersampling (was: RF/IF digital receiver)" that using a high IF
means that it will be more sensitive jitter in the ADC clock.

The LTC2203 does 25 Msps with a 16 bit output and has a front end
which
can handle 380 MHz.

The AD7763 does 40 Msps with a 24 bit output and includes a digital
FIR.
However, it's not clear to me what's the maximum frequency that it
can handle.
What's very interesting is that Analog Devices has an evaluation
kit
(EVAL-AD7763) available from Digikey for only 163 dollars and it
includes (according to the literature) a BF537 EZ-KIT Lite. This
appears
to be a very inexpensive way to experiment with SDR.

2) Convert the first IF to a second IF of 21.4 MHz and then subsample.

Advantages: Less sensitive to ADC clock jitter. Many different
crystal
filter are available for 21.4 MHz from places such as Network
Sciences.
This allows additional filtering to be done in the analog domain
which
should increase sensitivity.

Disadvantages: Involves an additional LO and mixer which means more noise.
ADSimPLL says the LO noise is -114 at 10 kHz. Mixer spurs at 7x8 and 8x9.
I'm assuming that the spurs are not that interesting given I'm using a LT5512
which is a double balance mixer (i.e. even harmonics don't occur).

I imagine that the AD7763 will handle subsampling 21.4 MHz.

3) Convert the second IF to a third IF of 2.9 MHz and sample using a AD9874.

Advantages: The AD9874 also contains AGC and an I/Q demodulator in addition
to a LO PLL and mixer. This means that the DSP doesn't have to handle these
chores.

Disadvantages: Involves an additional LO and mixer which means more noise.
ADSimPLL says the LO noise is -119 at 10 kHz. Mixer spurs at 6x7, 7x8, and
8x9. I'm assuming that the spurs are not that interesting given the AD9874
mixer is a double balance type (i.e. even harmonics don't occur).

BTW: I'm willing to sacrifice some performance if it means making the hardware
easier to build (i.e. allows for more slop in the PC layout and assembly).

What are peoples thoughts, opinions, and experiences regarding these types of
tradeoffs?

Sounds to me like the IF plan is a little screwy already, since the 200MHz IF is in the tuning band of 0.5 to 600MHz. Not sure how well that's gonna work for ya.

A 200MHz IF is a little agressive, but it's workable if your ADC has a SHA with good enough aperture time and you have a clean enough clock.

Personally, I'd pick a different first IF that solves the tuning and the sampling problem, but it may be tricky with such a wide tuning band.

Update: I tried the 26 turns of #10 wire for the input to the preamp, and a tuning loop of four turns of coax with the shield and center conductor connected, as per Joe Carr's shielded loop example, and the whole thing held together by winding #24 wire around the loop toroid style, with that as the Armstrong feedback loop. Waste of time. Couldn't tune the antenna to pick up anything. Put it on the test bench and determined that two turns of shielded coax was needed, in a smaller diameter loop. Then used one turn of #10 wire for the feedback loop and another for the pickup for the input to the preamp. It does work, but nothing like I expected or was hoping for. I

can tune the antenna to 10 MHz with my 10-400 pF tuning cap, but nothing very far to either side of that. And the Armstrong oscillator does it's job, but just barely. Am thinking I need more amplification for the Q-multiplier circuit. Currently using an NTE-451, with a gain of something like 100 or 120 if I remember correctly, and am going to try an NTE-199, with a gain of 400. May even put two of those in, in a Darlington configuration. I don't know. Making it up as I go along.

Also realized that I no longer actually have an MFJ-1020A, as I have replaced the tuning circuit from that schematic with a variable capacitor to tune the antenna and the Armstrong oscillator. The only thing left from the 1020A is the amplification portion of that circuit. Now trying to tune everything by tuning the antenna.

Would really appreciate any input anyone has, but will understand if all of this is too vague. Hope no one minds my posting. It helps me think of what I want to try next.

Thanks for reading. Sorry if I'm just wasting bandwidth.

Dave

Forgot to mention, I am using a 1K linear taper switched potentiometer to control the feedback in the Armstrong oscillator. Suspect I need a 10K pot. As soon as I switch it on, it peaks out, and then drops off as I turn it up. On the other hand, it does work, even if not to the level I had hoped for. Wanted to include this for those who wondered about the construction of the whole antenna/feedback loop/input to the preamp loop package and how feedback was controlled.

Again, sorry if I am just wasting bandwidth. Appreciate your patience.

Dave

> that's gonna work for ya.

Okay ... I need to pay attention to spurs from the first IF mixer when
working out a frequency plan.

For the sake of the original question let's assume that the RF range
has been changed to one which is appropriate for a 200 MHz IF.
The question still being regarding the tradeoffs of where to digitize
the signal.

Followup question being ... any good guidelines for picking the first
IF frequency other than:

1) High enough to simplify the input filters.

2) Something that is easy to build / buy a good filter for use after
the mixer.

3) Something that results in a minimum amount of spurs from the
mixer.

4) Something that isn't so high as to complicate construction more
than
necessary.

Hi John,

The BF537 EZ-KIT Lite + AD7763 for less than US$180 looks like a brilliant deal to me, but won't you need I as well as Q channel ADCs ?

I am not sure how much enthusiasm I can muster for a BF537 when only packaging available is 192 or 208 BGA, it sounds like a project that is always destined to be a prototype board. It does look like a very capable DSP however.

If you want to experiment with SDR, does it get any simpler than SoftRock 40 ? I guess I have a natural inclination to use a platform where there is an established user base - hence plenty of help and support.

My other inclination is also to try and keep the sample rate as low as possible, so there are plenty of un-optimized-code CPU cycles available to allow swift algorithm development rather than scrambling around for every last CPU cycle at the start of a project.

Having said that all out loud, my inclination is to go for a decent DDS LO, for front end agility, sampling down to a high sample rate (192kHz) stereo (I + Q) audio ADC and to take it from there in DSP.

With that all under my belt, then time to look at higher performance solutions, once the question is better understood.

Regards,

Mark

> AD9874.
>
-- snip --

I think you may be overdoing your concern on the sampling clock. The jitter that matters is the amount of time jitter on the clock. If you can generate a tone that's pure enough to down-convert the 1st IF, then you can generate a clock that's pure enough to down-sample. In either case, if you're crystal controlled you'll probably be much more stable than the LO with which you're doing your first conversion.

At this point you need to ask not can you _generate_ a time base that's low enough jitter to do good sampling, but can you _preserve_ the clean signal through your entire sampling path, starting with whatever logic generates the clock, all the way through to the actual sampling. If the sampling takes place inside the ADC then you need to hope (or verify from the data sheet) that the ADC isn't introducing much jitter. If you're really concerned about this then you could make your own sampler with appropriate components to insure the jitter is within your control.

Each frequency conversion inevitably reduces the IP3 and the KP of the receiver. The other problem with the multiple conversions is the feedthrough of the harmonics and intermods of the heterodynes to the input of the receiver; this creates the "deaf" points in the frequency range. So, the intention is avoiding multiple conversions unless it is really necessary.

The multiple conversion could be necessary if the high attenuation of the adjacent channel is required and if the desired channel bandwidth is too narrow. It is difficult to make a good narrowband filter for the high IF.

The clock jitter can be taken care off. The suppression of the aliases is determined by the 1st IF filter. You will need a good filter, especially if subsampling.

[...]

The intent would be to implement a digital downconverter in the DSP.
That of course begs the question of how much horsepower is necessary
to implement a DDC? I know people are doing it using FPGA, however
I haven't seen anyone doing it using a DSP.

Another option would be to insert a AD6620 which is a digital down
converter.

Defined as the best as I can implement without having a mental
breakdown,
going broke, getting into trouble with the wife, or taking forever.

I realize that in the real world the requirements should be a little
more
concrete.

> What benefits do you expect from doing the processing in the software?

Flexibility and learning.

> How much of time and money do you have?

A lot of time ... one advantage of this being a hobby project is no
deadline.
Money is flexible, not unlimited (I do have to answer to the wife),
say
$ 1000 US dollars (more if spread over a longer period of time :-).

Currently the design calls for using a AD9952 DDS followed by
a 10.7 MHz BW=300 kHz crystal filter to provide the reference
for a ADF4002 PLL controlling a UMC VCO. ADIsimPLL claims
phase noise of -107 at 10 kHz.

If the sample rate is low enough there's no reason the DDC can't be
done in software. Since your signal is narrow that might be possible
if you can sort out the IF issues and the IF filter bw.

The 300kHz filter is for the DDS output which is the reference for
the PLL so that I can vary the reference frequency enough to generate
a precise LO. It is not the filter for the IF.

I've heard that high side mixing is preferred to low side
mixing because the LO harmonics will be higher and less
likely to cause problems.

It also seems to me that (f1 + f2) is typically discarded
and what's used is just the (f1 - f2).

Any truth to either of these impressions? If so, what's
the rational?

Depending on the availability of off the shelf VCO parts
one might what to use (f1 + f2) or low side mixing and I
was just curious what (if any) additional problems I should
look out for.

I was looking at fraction of an octave, however I have yet to decide anything more specific. Actually I started by playing with Ansoft Designer to design the filters, keep being unhappy how they turned out, and as a result keep having to increase the first IF to make it easier to have good image rejection. I had naively started with 10.7 MHz as the first IF ... I may not have a lot accomplished, however I'm certainly learning a thing or two. :-)

It's easier to dodge harmonics and higher-order mixing products.

For _any_ IF/LO combination you should make a table of the possible
mixing products of the first few harmonics of your RF range with
several harmonics of your LO range (most modern mixers generate _lots_
of odd harmonics of the LO internally). If any of these products other
than the intended pair span the IF then you'll have problems with
spurious mixing.

WOW, that was FAST!!! Is that all you do? Sit there in your parent's
basement waiting for someone to order one of your hack-jobs when you
can't even give an estimate on when they will go into full production?
Don't you have anything better to do? I mean, heck..... look at posts
from yesterday afternoon, one of the biggest national holidays, when
just about everybody can find something to do besides jerking off in
front of a computer. It seems that the only people who posted were you
and the trolls. And yet, even with all that spare time because you
couldn't drag your ass away from the computer and out of the basement
long enough to join the rest of humanity in a barbecue, you AGAIN
refused to answer the tough question, just like you have done for
several years now.....

Where's the schematic for your hacked amp, Brian?

1837. Naming the title of your webpage

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-05 23:02:56 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <5f5bkqF3bmn91U1@mid.individual.net>
Source record: 7078

Hi.

I often search for people's web-published homebrew receiver, transmitter, or transceiver projects.

Can I please encourage those that design these radios to try to conform to a standard when choosing the title name of your webpages. That would make it better when searching for radio projects.

I was thinking that a convention could be something like the examples below:

"DX Chaser 5" AM Multiband Receiver

"Super-smashing-great-all-singing-and-dancing DX sniffer" 20m Monoband SSB receiver

"The better than Pixie" 30m CW Monoband Transciever

"Goblin 80/40" 80/40m CW/SSB Dual Band Tranceiver

"Babe Radio 77" 10m FM Monoband Transmitter

The thing is to try to name the page so that folks can put a search string together i.e:

"CW Monoband Transceiver"

"SSB Monoband Transceiver"

"AM Multiband"

"80/40 CW/SSB" Transceiver

Etc etc.

Although I think maybe if one searches the name of the title page only, there might not any advantage in using a search phrase.

It might even be good to put "homebrew" in the title as well.

Well, I think it's a good idea. :c)

I do find that I want to identify receivers only, transmitters only, and transceivers only, and whether monoband (and what band) or multiband, and what mode(s).

Perhaps someone can come up with a better naming convention.

Thanks.

Oh dear, are you selling oscilloscopes and test sets in order for buyers to
set their radios correctly?
You really don't have any technical knowledge. All you seem to do is
re-sell boards made by other companies.
You should see what people are saying about you in other groups, you have a
terrible reputation.

Hmmm... what company am I buying boards from?
Maybe I can stop designing... and just get the boards from them... lol
Thanks for your comments... they were quite amusing.

I'm afraid your idea won't catch on, as it seems to make sense(at least
to me!).
My wife (also a ham) complained about the time_sink of surfing the web,
looking
for that unread receiver article.But she decided it was cheaper to read
about
radios and such on the web, rather than actually buying them and bringing
them
home.
Along with your naming convention, I'd hope that everyone would make
PDF's
of all such articles.
Any websites you would recommend for the high_perf receiver fan????

Gregg,
There is no excuse for how many out here conduct themselves... but
there are reasons.
The main reason is that they have nothing of merit to add to any
conversation here, but desperately need to be recognized.
Thanks for your comment.

Why don't you ask Twistedhed about that one. I fought him for years on
a political issue only to find out that I was wrong. I still disagree
with his freebanding, but when I'm proven wrong, at least -he- knows
that I'll stand up and take my punches.

I'm giving you a chance to prove me wrong, Brian. If you product works
like you say it does, and it doesn't cost you any money, why in the
world -wouldn't- you be willing to sell me one?

>P.S. How's your master's degree from the College of Culinary Arts

>want fries with that"?

No, but last March I did finish a study on EM wave interference
pattern and polarization interactions in atmospheric media of varying
ionization. It was a joint project with the meteorology department in
the study of weather radar, with extended applications to satellite
communications. Got any opinions on the subject, Brian?

Oh, and where's that schematic for your non-linear linear?

Absolutely right. These are discussion groups, but some people would
rather use them as their own personal media for spamming products that
would otherwise be pulled from the market for patent violations and/or
false advertising. It's truly shameful how these basement-dwellers
act, isn't it, Brian?

Die hard with a spam vengeance! (bruce willis is resurrected/bald too)

Brian is only about twenty years late with his CB noise toys, he might have sold a gaggle of them in the 70's if he wasn't so busy with his paper route at the time.

"LOL"

Source record: 7096

Good Day All!

Have recently aquired a "homebrew" receiver which I am trying to upgrade and fully restore to working order.
In the back of my mind I am quite sure that it was a published design possibly in "Electronics Australia" or similar back in the 1960's or early 70's.
It is a 6 valve/tube design using an ECF82 first mixer/oscillator (1st if about 4 Mhz)
, a 6BE6 Pentagrid second mixer/osc, originally with varactor fine tuning down to 455 KHz. 2nd oscillator on about 4.5 Mhz.
It then has 2 stages of 455 KHz IF originally using EF183's with 2 IF transformers per stage, a total of 10 tuned circuits at 455 Khz.
This is followed by a 6BE6 product detector/BFO (Drake style) or a diode for AM rception and an ECL82 for audio stage and output.
It has 4 bands from about 3 MHz to 30 MHz.
Does any one remember coming across this circuit?
It has some rather eccentric features like IF neutalisation and a VERY lossy coupling between IF stages.
Any information gratefully received as I would like to
1. find an original circuit.
and
2. Find out why some of the peculiar design details were used.
Hope it rings a bell with someone.

1856. Naming your projects

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-07 12:38:05 UTC
From: Richard <nearlynews_email@ntlworld.com>
Message-ID: <5f9fp3F3b7n3uU1@mid.individual.net>
Source record: 7097

You designers (bless 'em) that advantage us with your design skills and projects : Can I please encourage you to always (within reason) name your creations. I think that would be beneficial for web searching for other people's comments, or searching for how they implemented your designs.

Take for instance the following actual descriptions:

"The AP-80 An Alternative Pixie"

(Fine, the rig is called "AP-80")

"Low Cost AM SWBC Radio"

(Problem. No rig name)

"(Fairly) Simple 75M SSB rig with PTT"

(Problem. No rig name)

"SSB Receiver / Exciter and Linear amp"

(Problem. No name for the exciter, or RX)

Allocation of a name or number to whatever you design would help. IMHO. It seems a pity that we have a great resource in the web in search engines, but their usefulness is limited by failing to properly name.

1857. Re: Naming your projects

I wonder if we who are the Usenet-frequenting Radio Hams might somehow get together to sort out the dreadful mess that has been created in no small part by the self-interest of those who control the RSCB?

Might we all act together to produce a series of soggy "biscuits" that could then be assembled Lego-like fashion to produce any rig or test equipment? This would have a number of benefits, not the least of which would be the bankrupting of the cancerous emporia whose off-the-shelf Cheque-Book (CB) radios are not only discouraging the homebrew engineering that is the essence of _REAL_ Ham Radio but also encouraging an altogether undesirable element to regard themselves as of our ranks. Once the advertising income from those dead emporia ceased to flow, then the national societies might get back to supporting technical excellence instead of Complete Bullshit (CB) as they do now?

(And, no, I'm not thinking in terms of the facile hardware exercises that bring on the disease known as the gangrenous degeneration that is the M3/CB Fools' Licence scheme; facile because once a so-called "licence" has been granted the hardware diversion is largely forgotten.)

Anybody interested in mutual development of some soggy biscuits is invited to reply to the author via these fora.

Cable TV uses a multi-core cable with aluminum shield. If suspended above ground between houses then there is also a steel wire around it, at least in my area. The steel makes a good antenna, and a thumb-tack makes a good contact with the aluminum shield.

Fence-wire in our neighborhood makes a good 160-meter antenna, and it is already erected ;-)

Try loading your 80-metre TX into the telephone cable, providing it does not lead underground.

In Northern climates they have 2 parallel 20-metre long metal rod,s like a ships handrail, to stop snow sliding off the roof and burying passers-by. Go inside the roof space and connect to it.

There are loads of ready-made antennas without having to buy anything at all. Just use some of them when the neighbours are asleep (in this area that is during the day).

OK......what planet have you been on for the last 40 years? - check
out a thing called the "integrated circuit" or "IC" for short.

These are wonderful devices, they come as little plastic blocks with
pins sticking out of them. You connect signal in/out, voltage, a few
extra components to set parameters, and there you have a functioning
electronic circuit....

Please, stop ranting about the decline of AR and start reading a few
contemporary textbooks, or browsing manufacturers sites (they actually
WANT you to use the things, so publish lots of free information and
"application notes"...) or search the internet...

Stop complaining so much about the demise of the "good old days" and
start moving into 2007........

Andrew VK3BFA.

I'd been thinking for some time about doing a little experimenting that
involved putting together a few functional blocks which were a little
more involved than ICs, things like IF gain blocks and detectors and
the like. Much faster to A/B test circuits that way.

With this suggestion solving the aerial problem then you need a good ground to go with it. Maybe you could tie one end of a spool of wire to a wad of paper and flush that down the toilet. When the spool unwinds to the end you just connect that to the ground lug on your ham rig and you have a long counterpoise wire installed underground. It is even inside a protective conduit. What more could you ask for? LOL

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society

Source record: 7117

Hello,

Assuming I could made a nice rochelle salt crystal like the one shown here: http://seawhy.com/xlrs.html, any suggestions on how to proceed to make a piezo earpiece?

Some possible thoughts:
a. Spring clamp copper plates to 2 opposing surfaces and test with a multimeter for piezo effect, then super glue a malleus to the top plate and touch it to a foil drum. The plates are the electrodes.
b. Make a foil 'setting' for a small crystal, and touch the crystal to a foil drum. The 'setting' and the drum are the electrodes.
c. Load several small crystals into a shallow can and insert a copper plate with malleus [which touches a foil drum. The can and plate are the electrodes.

Joseph

1877. PCR1500, with or without remote head?

Hello Folks,

The PCR1500 is around $500, and $100 more if you want the remote head. It's tough to get much info on that remote head. Heck, it's not even in the manual, at least not the large pdf version on the Icom site. Is it worth to have?

I am not too familiar with ham stores in the US yet, wish the ad section of QST was on the web somewhere. Anyhow, one that seem to be large is AES. Other suggestions?

Joerg -
Not sure what this is doing on the homebrew group.

I did briefly get to try an associate's PCR1500 at his house. He did not have the remote head but was controlling it from a laptop.

I was very unimpressed with the way that local BCB and FM stations had images showing up and down and all around the SW and ham bands. Somehow I had expected some preselection.

I believe that with an outboard preselector or even just some traps to filter out the local stations before they hit the radio, I would've been much better impressed. The PCR1500 wasn't much worse than a typical $100-$150 SW receiver in terms of image susceptability (our neighborhood I think is particularly bad for the US, but I understand it to be nowhere near as bad as many major European cities).

I also have a RX-320 (Ten-Tec's computer controlled receiver) and while it is not completely immune to BCB interference and images it is a much more minor problem there. It's also true that the RX-320 is truly aimed at the SW market.

The PCR1500 had a bazillion nifty computer-controlled features that my friend was showing me (esp scanning VHF and UHF channels). He was more of a scanner nut than a SW or ham listener, and he seemed positively delighted with the radio and all it's features and computer controls and scanning channels and ability to monitor multiple channels at once. He had some special computer software that decoded and monitored at least a couple of the local trunking systems.

Like when I'm using my RX-320, I missed having real knobs. I'm guessing that the remote head actually provides some knobs (but have not seen it either!)

Tim.

Yes. This is (usually) IC's on a PCB with the extra bits needed to get it to work. As long as you have the same impedance for each module, no worries. And the approach has merit - lacking sophisticated measuring equipment, its good to have a "reference" IF, RF, whatever module for A-B comparisons.

I think EMRFD covers this concept quite well....

There has NEVER been a better time to homebrew. We are not relying on war surplus from a global conflict anymore, and its pretty well dried up anyway. So many fascinating chipsets out there, a casual reading of any of the last 10 years of ARRL handbooks reveals this "systems engineering" approach - treat them like LEGGO blocks....

There is SO MUCH sophisticated good quality test equipment out there now - most industries are downsizing (gee, I love that phrase) - its cheaper to send a defective module off for repair (the spare automatically switches in on a fault condition) to the manufacturer than maintain highly skilled staff and expensive test gear. So, the test gear is being sold at RIDICULOUS prices. I recently bought a Chinese 500Mhz spectrum analyser for $500 - yeh, sure, not as good as a HP, (refuse to call them AGILENT) but then my 30 year old HP141 etc was badly showing its age and was out of calibration anyway.....

A good example - the AD9851 DDS chip . Wade through the pages of waffle, and it comes down to half the pins grounded, some more tied high, data in from a PC port on 3 lines, bias set by 1 resistor, a TTL clock module (prebuilt anyway) and a simple LPF on the ouput - voila, a 0-30Mhz sig gen/sweep gen/VFO with 1Hz increments, and crystal stability and accuracy. Doesn't need a complex PCB, can easily be paddyboarded/Manhattan style....

Go for it - don't be scared. The "good old days" were only in your head anyway, and it took the death of millions to provide us with that

lovely war surplus precision mechanical engineering....what a terrible price to pay for a nice VFO capacitor and drive....

Times change - the Foundation license has transformed AR - yes, some idiots, but not nearly as many as the old timers noisily bemoaning their lost (and rose coloured) past.......all the dinosaurs will eventually die, do you want to be one? And getting an amateur ticket 30 years ago - how relevant is that now? - good to wallow in antique technology, but how about moving forward.

My club - its been bloody fantastic. The new F calls, on the committee, bring new skills and enthusiasm. They can organise a dinner out - the old timers cannot. They organise technical lectures - the old timers, with their "I did that 40 years ago" attitude don't. A long overdue breath of fresh air - should have happened 30 years ago, and would have except for the moaning and bitching of the "true" amateurs.

So saying that, I have been licensed for 36 years. I started homebrewing with valves I scavenged off the rubbish tip, as a kid of 12 I didn't have any money. First soldering iron was second hand, bought from the local radio club - in retrospect, sold at a fraction of its value to help a newcomer. Was mentored by WONDERFUL, true amateurs - generous with their time and knowledge. Are you? Carefully selecting the least leaky capacitors, measuring and marking old out of tolerance resistors to build something,anything, to explore radio. Even scavenging hookup wire from old washing machines and refrigerators on the tip.

Nowadays, still have a good collection of WW2 vintage gear for restoration - most of it semi vandalized by idiots doing "modifications" - I like it, nice BIG components, easy to see and work on. The classic 70's radios with tube back ends - easy to work on, parts more readily available than modern consumer stuff on the shelves currently.

But I also battle with SMD stuff - why, because that too is interesting - 1 chip does the work of a rackfull of valve gear. Its STILL the "magic of radio" - and I think a lot of us have got old and tired and grumpy and forgotten WHY we got into AR in the first place,

Go for it - NOTHING beats the thrill of learning, exploring,experimenting, and finally getting on the air and saying

"The rig here is homebrew OM"...

Club Station IQ7MU

Italian amateur radio 70-MHz experimental campaign

- BREAKING NEWS -

Upon request of Luca Ferrara IK0YYY, the Italian Ministry of
Communications, in coordination with the Ministry of Defense, is
willing to kindly authorize an amateur radio experimental campaign on
the 70-MHz band (4 meters) up to December 31, 2007. Activities will
however only be possible after the authorization has actually been
signed. Such campaign is being carried out under the technical
coordination of Piero Tognolatti I0KPT, Full Professor of the
Electromagnetic Fields Group and Director of the Electrical
Engineering and Information Theory Department of the University of
l'Aquila.

The technical parameters are:

• Modes: all (SSB, CW, AM, FM, RTTY, digital modes, etc.)
• Frequencies:
- 70.100 MHz ☐ 12.5 kHz
- 70.200 MHz ☐ 12.5 kHz
- 70.300 MHz ☐ 12.5 kHz
• Maximum RF power: 25W EIRP
• Operational area: the whole Italian territory except for a
30 km strip from the Austria, France and Switzerland borders
• Antenna types: omnidirectional and directional

The experimental campaign, whose results will be published after its
conclusion, is open to all Italian radioamateurs.

A beacon transmitting on frequency 70.088 MHz (mark) with FSK modulation (500-Hz upward shift) is shortly going to be installed. This is at the very low edge of the authorized band.

We wish to express our warm thanks to the Italian Ministry of Communications (Ing. F. Troisi and Dr. A. Cascio) and to the Italian Ministry of Defense, who, despite the administrative and operational hurdles, have once more given the Italian radioamateurs a clear sign of esteem and credibility. Sincere thanks are also given to the Università of L'Aquila (Prof. P. Tognolatti) for its exquisite and effective cooperation.

Luca Ferrara IK0YYY – Antonio Vernucci I0JX

Well, it's the only one I am subscribed to but I'll look for a more appropriate one. Also, I figured that folks who still build their own stuff (I do) would naturally gain more insight about commercial hardware than "plug-and-play" users. Because they can pinpoint effects to circuitry deficiencies just like you did below.

A fat mixer or even some LC filtering probably wasn't in the cards at that price level. But I could live with it because I mainly want to use it for EMI hunting. Being able to listen to noise makes it sometimes easier to find the root cause. Most spectrum analyzers feature only a rather crude AM demod output, or none at all.

So, for example I'd probably roll a 123MHz bandstop for work here in the lab because the local runway is almost next the house and 123.05MHz is where they call in or key the runway lights on at night. With clients at other airports it's similar, I can look up their frequencies and build a filter before heading out.

I guess that's why they still block cell bands for the US. Wish they
didn't because I have to check for EMI seemlessly up to 1GHz.

Same here. But when you have to schlepp it along on flights the small
size and low weight is a real advantage and the laptop has to come along
anyhow, usually.

1882. question on LP filter

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-12 20:17:04 UTC
From: francesco.messineo@gmail.com
Message-ID: <1184271424.548662.168650@g4g2000hsf.googlegroups.com>
Source record: 7123

Hello,

I'm modifying a 28-50 MHz transverter to work the new (for us) 70 MHz band, not having a spectrum analyzer I'm trying to get as close as possible with substitutions. I have a doubt about the low pass filter after the final amplifier:
on the arrl handbook I have found formulas for pi-filters:

```
----|----L------|--------
=C/2 =C/2 R
----|-----------|---------
```

(I hope the ascii art is readable)

L=R/(pi Fc) C=1/(pi Fc R)

Now the 50 MHz original filter is composed of three cascaded filters as the one above, the capacitor are 47pF at the two ends and 100 pF the two middle ones, which is consistent with the formula as the middle ones can be actually seen as two parallel capacitor for the cascaded pi-cells, the formula indicates an Fc of about 63 MHz with these values, which seems correct.
The inductors are 6 turns, internal diameter 6 mm, enameled 0.8 mm wire, no spaces between turns for the two "external" inductors and 7 turns same diameter for the internal one.
These inductors should have an inductance of 0.17uH the 6 turns ones and 0.21 uH the 7 turns one and the formula don't agree with these values, can anyone explain where I'm wrong?
Thanks in advance

Francesco IZ8DWF

> In most cases when I encounter that I scale the values by 50/70 (.714)
> so that the 47 pf becomes around 33 and the 100pf around 68 and same
> for the coils. That maintains the same relationships and impedences
> overall.

Actually I found my mistake, the formula I was using for inductance
required the external coil diameter and I was using the internal
diameter, so everything is clear now.
For instance the values you suggest are just right even calculating
with the formulas for a scaled cutoff frequency of about 90 MHz.
By the way, this filter is clearly for 50 ohms both input and output,
one side is the antenna and the other side is the output impedance
adapter filter of the final transistor.

Now the question is if I should try to use the same final (and driver)
transistor of the original 50 MHz transverter (2sc2166 driver and
2sc1969 final) which are 27 MHz transistor (working fine at 50 MHz).
On the datasheets I have been able to find there's no indication of
their ft.
I have a better final transistor but it would require me to move the
amplifier part outside of the original box (different case).

Thanks and 73

Francesco IZ8DWF

1885. Need sources for pot with planetary drive

Newsgroup: rec.radio.amateur.homebrew

Greetings:

Please view these photos of a three-turn planetary drive
pot that uses a conventional "stackpot" formfactor at
http://www.cybertheque.org/homebrew/rcvr/images/antennas/pot.jpg
Resistance = 1K

It was made in 1966 by CTS; stampings: 36129 137.6637

Does anyone recognize this pot technology? Any suppliers
nowadays? I need the form factor for modifications to antenna
rotator assemblies in a space that does not permit using
larger multi-turn pots and using trimmer versions is not
sufficiently robust.

Regards,

Michael

i remember these used to have slippage problems at the ball to shaft (after
a few hundred rotations) and required feedback looped mechanical drives to
accurately position anything they were used to control.

try something new!

I am not a ham; but got a response from a G amateur who confirmed he used plastic coated steel cored clothesline wire for his antennae in northern Britain.
He mentioned he was located in a fairly windy area and said that even though the plastic eventually cracked and the wire corroded it lasted quite a few years and was strong and reasonably cheap.
For occasional 'quick and dirty' receiving I capacitively couple my receiver to our steel cored clothesline (all of 6 feet above ground!) by wrapping some turns of wire around it. BTW I must go and bring in the towels drying on it!
Have also used the steel messenger wire stripped/salvaged from scrapped cable TV drops. Cable techs sometimes just abandon it and or will give you the old when they install a new replacement drop.
Cheers.

No: But I vaguely remember a QST article of the 1950s? about a
receiever that used many 'stagger tuned'? IF circuits to get bandwidth
suitable for amateur work? Also IIRC it was an American husband-wife
team who wrote the article?

Wow, I had seen those in the past but not for many many years.

If you are truly updating some rotators, there are some articles in
QST, CQ, 73, etc. from the past 20-30 years on doing it using
something other than 360-degree pots. Some of them use essentially
homebrew shaft encoders.

I remember them, also, and the slippage. I used to lube them to make
them work better. They didn't.

I now know they must never be lubed and must be kept really clean.
They work because of the friction between the shaft, the ball and the
housing. Our pick-and place machine, used to place SMT components on
circuit boards, uses the same technology to convert rotary motion to
very accurate linear motion. The wheels and shaft must be kept very
clean, or we get positioning errors.

I have no clue about the current source of the devices, but probably
have a few in the junk box!

agreed, i have used pc mouse encoders with a hacked mouse circuit board for various projects.

2 axis, three butttons , plenty of easy to use software, even write your own visual basic

can even determine direction and speeds!

its all simple enough and uses standard rs232 ports.

mouse click buttons can be used to determine limit positions at extreme points

the newer mice with some 6 or 7 variables can do lotsa stuff!

Do you mean the rotator or the controller?

For the rotator, you can maybe use a standard pot with gearing. I made an old 3 wire rotator a 5 wire with a pot an a 4 to 3 gear. One gear was fixed to the output shaft, the other to the pot, so that one full rotation (360 degrees) of the rotator shaft turned the pot its full path, or therabouts (270 degrees). The controller just had a typical 270 degree pot and a 3/4 scale that rotated N-E-S-W-N.

Interesting. I've never seen a pot like this.

So the turns ratio is determined by the shaft diameter to ball
diameter ratio?
And the wiper arm is connected to the ball carrier?
So this assumes the metal to metal, shaft to ball won't slip, but the
ball will turn in the carrier, causing the carrier to have 1/3 the
rotation of the shaft?

Sorry, this doesn't help you at all...
Alan Nishioka

<snip>

I had considered gearing but the available space and the
necessary additional fabrication was more involved than
the solution I chose.

Here are photos of the modified rotor:

http://www.cybertheque.org/homebrew/rcvr/images/antennas/rotor/

This rotor is common to a number of makes and models; the controller
that came with it was for the Cornell-Dubilier AR22R, an interrupter
based spring and escapement controller version.

The modifications permit continuous rotation and rely on the
controller to manage limits.

The ratio, is determined by the shaft diameter, to the internal diameter
of the casing in which the balls sit.
If (for instance), you have a 3mm shaft, and 10mm balls, the casing has to
have an internal diameter of 26mm, and the ratio is 26/3 = 8.66:1. The
drive can be made remarkably good (the same system is used on some micro
focussers for telescopes, which carry significantly more torque than
needed for a pot). Units like the 'Williams optics feathertouch focusser',
use exactly this drive.

Best Wishes

==========
Sorry ,but I don't understand the above .
If the shaft has a diameter of 3mm and the balls a diameter of 10mm, the
inner diameter of the casing should be 10 + 10 + 3 equals 23 mm

When the shaft makes 1 revolution the balls will make 3/10 revolution .
When the balls make 1 revolution the casing makes 10/23 revolution .
Hence when the shaft makes 1 revolution the casing will make
3/10 * 10/23 equals 3/23 equals 0.13 revolution , hence reduction factor
is 7.7
Please correct me if I made an error.

I could be missing something, but at first glance I read the radius as
the diameter of the 10mm ball (10mm) plus half the diameter of the 3mm
shaft (1.5mm) and get 23mm internal diameter, ratio of 23:3 or 7.66:1.

Just in case this turns out to be a corecktion I've included speling
erors to comply with tradishun.

Yes. Sorry, I just added up the internal diameter wrong....

It is fairly simple to visualise what is happening, if you realise that
the balls are rolling round the internal diameter of the casing, driven by
the small shaft at the centre, and for the assembly of three balls to
complete one complete turn, their surfaces, must travel the internal
diameter of the outer casing. Since the surfaces of the balls are driven
by the internal shaft, you get the ratio from the ratio of these two
diameters.

Best Wishes

I had never heard of a piezo tweeter before your post. They sound like a different type of device than what I am pursuing. I need an earpiece with very high impedance, one that can work off of the nominal potential a crystal radio circuit can produce.

But hey, thank you for the feedback, my world is ever so slightly larger than before...

Go to <http://www.allelectronics.com> and do a search on their
website for "piezo".
They have a number of Piezo elements available at reasonable prices.

>
> Francesco IZ8DWF

Hi Francesco,

I guess you have things figured out pretty well now, but for future
reference, I'll offer a few additional points:

-- You can get some pretty decent filter design software for free from
www.aade.com. It will tell you a lot about the expected performance
of the designed filter. It also has coil design help, though the
dimensions are in (ugh) English units.

-- You can also get the evaluation/student/ham version of Elsie from
www.tonnesoftware.com. I've been using the professional version for a

while now, and I think the value/price ratio is very good. I've evaluated some much more expensive filter design programs that offer only marginally better features.

-- For coils used at HF and above, you will get better Q if you use a little space between turns. That is, if you need a coil with, say, 1mm turn pitch, it's better to use wire that's about 0.5 - 0.6mm diameter, than to use wire that's 1mm diameter. For example, according to a coil program I use and trust, your 6 turn coil should be about 186nH, with a Qu of 150 at 50MHz. That's using 21AWG (0.724mm) wire with 0.80mm turn pitch. Changing to 26AWG wire, same turn pitch, now the pitch is about 1.9 wire diameters, so there's almost as much space between turns as the wire diameter. Now the inductance is predicted to be about half a nanohenry less, but the predicted Q is 175. You might think at first that the larger wire will have lower RF resistance, but the proximity effect of closely spaced wires dominates as the turns are immediately next to each other.

-- You can wind coils with nice even spacing by winding them on the threads of a bolt. After you unscrew the bolt, if the wire diameter is fairly large for the particular coil diameter, the coil may well be self-supporting enough to be useful as-is. You can further stabilize it by putting a couple rows of appropriate glue parallel to the axis of the coil, making it look a little like the old "Air-Dux" coils. Use glue with reasonably low dielectric constant and low RF loss.

Hope this is helpful.

Cheers,
Tom

1912. flush mount plastic 9v battery holder/compartment with cover?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-18 23:00:06 UTC
From: Mad Scientist Jr <usenet_daughter@yahoo.com>
Message-ID: <1184799606.096177.218550@x40g2000prg.googlegroups.com>
Source record: 7003
Cross-posted to:
sci.electronics.components,alt.music.makers.electronic,rec.music.makers.guitar,rec.radio.amateur.homebrew,alt.inventors

Does anyone know where you can order a plastic 9v battery holder with
a snap off cover that flush mounts in a project box, guitar body, etc?
It would be like the AA battery holder in this Synsonics Terminator
guitar except for 9v:

http://meatexz.com/cheesyguitars/terminator/4c_1.jpg

So far for a 9v battery, the closest thing I have found is this:

http://images.google.com/imgres?imgurl=http://www.kemo-electronic.com/bilder/g03b/g03b_320x229.jpg&imgrefurl=http://www.kemo-electronic.com/en/gehaeuse/g03b/index.htm&h=229&w=320&sz=10&hl=en&start=285&tbnid=u0FQeM-PG-g8XM:&tbnh=84&tbnw=118&prev=/images%3Fq%3D9v%2Bbattery%2Bholder%2B%26start%3D273%26gbv%3D2%26ndsp%3D21%26svnum%3D10%26hl%3Den%26sa%3DN

except this doesn't have a lip that would allow you to cut a hole in a
project box (or in my case a guitar body) and screw it in so it mounts
almost flush to the surface of the box (maybe about 1/8" or 2/8" would
project out from the surface, the lesser the profile the better).
Also, the cover slides off to the side but I am looking for one where
the cover lifts off straight up (again to facilitate mounting).

Any tips appreciated!

$16 for a battery holder!!?#$

Bring your Vaseline.

1916. making money

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-19 17:08:09 UTC
From: william <onedragon396@comcast.net>
Message-ID: <1184864889_2465@sp12lax.superfeed.net>
Source record: 7007

THIS IS GUARANTEED TO MAKE YOU MONEY!
READING THIS COULD CHANGE YOUR LIFE! I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across
an article similar to this that said you could make thousands of dollars within weeks with only
an initial investment of $6.00! I was curious, so I kept reading. Anyway, it said that you send
$1.00 to each of the 6 names and addresses stated in the article. You then place your name
and address in the bottom of the list at #6, and post the article in at least 200 newsgroups.
(There are thousands!) You can also e-mail it to some people. No catch, that was it. So after
thinking it over, and talking to a few people first, I thought about trying it. I figured: "what
have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00.
Well, GUESS WHAT! ... Within 7 days, I started getting money in the mail! I was shocked?
I figured it would end soon, but the money just kept coming in. In my first week, I made
about $25.00. By the end of the second week I had made a total of over $1,000.00! In the
third week I had over $10,000.00 and it's still growing. This is now my fourth week and I
have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth
$6.00, and 6 stamps, I have spent more than that on the lottery! Let me tell you how this
works and most importantly, why it works... Also, make sure you print a copy of this article
NOW, so you can get the information off of it as you need it. I promise you that if you follow
the directions exactly, that you will start making more money than you thought possible by
doing something so easy! Suggestion: Read this entire message carefully! (print it out or
download it). Follow the simple directions and watch the money come in! It's easy. It's legal.
And, your investment is only $6.00 (plus postage). IMPORTANT: This is not a rip-off; it is
not indecent; it is not illegal; and it is virtually no risk -- it really works! If all of the following

instructions are adhered to, you will receive extraordinary dividends.
PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be
yours in 20 to 60
days. This program remains successful because of the honesty and
integrity of the
participants. Please continue its success by carefully adhering to the
instructions. You will
now become part of the Mail Order business. In this business your
product is not solid and
tangible, it's a service. You are in the business of developing
Mailing Lists. Many large
corporations are happy to pay big bucks for quality lists. However,
the money made from
the mailing lists is secondary to the income which is made from people
like you and me
asking to be included in that list. Here are the 3 easy steps to
success: STEP 1: Get 6
separate pieces of paper and write the following on each piece of
paper "PLEASE PUT ME
ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside
EACH of
the 6 pieces of paper so the bill will not be seen through the
envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them. You
should now have 6
sealed envelopes, each with a piece of paper stating the above phrase,
your name and
address, and a $1.00 bill. What you are doing is creating a service.
This is absolutely legal?
You are requesting a legitimate service and you are paying for it!
Like most of us I was a
little skeptical and a little worried about the legal aspects of it
all. So I checked it out with the
US Post Office (1-800-725-2161) and they confirmed that it is indeed
legal! STEP 2: Mail
the 6 envelopes to the following addresses:

1) A. Mosley F. D. R. Station PO Box 7455 New York NY 10150 - 7455 (USA)
2) J. C. Lamb 150-33 108TH AVE. Jamaica NY 11433 (USA)
4) A. Hutchins 1501 Shepherd Rd. APT.160 Lakeland FL 33811 (USA)

5) S. U. Peeler 209 N. Belcrest Ave apt. c202 Springfield, MO 65802
6) w. garland 5330 goshen rd. #43 fort wayne, in. 46818
STEP 3 : Now take the #1 name off the list that you see above, move the
other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR name as
number 6 on
the list. Now, post your amended article to at least 200 newsgroups.
(I think there are close
to 24,000 groups.) All you need is 200, but remember, the more you
post, the more money

you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1241 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way, if you are of integrity, the program will continue and the money that so many others have received will come your way, too.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reached the #1 position you will be receiving thousands of dollars in CASH! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above). Send it now, add your own name to the list and you're in business! ---DIRECTIONS----FOR HOW TO POST TO NEWSGROUPS---------- STEP 1: You do not need to retype this letter to do your own posting. Simply put your cursor at the beginning of this letter, click and hold down your mouse button. while continuing to hold down the mouse button, drag your cursor to the bottom of this doc**ent, and release the mouse button. At this point the entire letter should be highlighted then select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. STEP 2: Open a blank 'notepad' file from accessories in windows and place your cursor at the top of the blank page. From the 'edit' menu select 'PASTE.' This will paste a copy of the letter into notepad so that you can add your name to the bottom of the list and to change the numbers of the list. STEP 3: Save your new notepad file as a '.txt' file. If you want to do your postings in different settings, you'll always have this file to go

back to. STEP 4: Use Netscape or Internet Explorer and try search for various newsgroups
(on-line forums, message boards, chat sites, discussions). STEP 5: Visit these message
boards and post this article as a new message by highlighting the text of this letter and
selecting 'PASTE' from the edit menu. Fill in the Subject, this will be the header that
everyone sees as they scroll through the list of postings in a particular group, click the post
message button. You're done with your first one! Congratulations... That is it! All you have
to do is jump to different newsgroups and post away, after you get the hang of it, it will take
about 30 seconds for each newsgroup! ** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO
POST A MINIMUM OF 200**
That is it! You will begin receiving money from around the
world within days! **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **

Maybe "Figure H" here..?
http://www.mouser.com/catalog/630/1742.PDF

And it's only $4.

It doesn't really lend itself to mounting in a guitar body like the
examples he gave but it might work for what he wants, and why didn't you
say so in the first place, why did it take someone else goading you in
to it after you made some snide comment about someone else's positive
suggestion?

Because I figured someone else might have the wits to look in the Mouser
catalog "in the first place".I had assumed that everyone checks
Mouser/Digikey,etc. My bad.
That was the first place I looked,and the first example I found.I'm sure

there are other sources,if ya look around a bit.

$16 for a battery holder is robbery,IMHO.

1922. FT2600 and APRS

Newsgroup: rec.radio.amateur.homebrew

I have a Yaesu FT 2600 2m mobile and a Garmin eTrex hand held GPS device.

If I wanted to install this in my car so I could use APRS to track my location, would I need any other hardware? (TNC?)

Thanks es 73

The Medical Community's Cheap Trick - What Is The Shank? - Discoloration Of Sexaling Organs - Sexaling And Prayer Statements - The Butt Hole Sexaling Organ And The Shank Sexaling Organ - Nerves - Nerve Units As Living Beings, I.E., Creatures - Brains And Notational Thoughts - Feeding The Organ Kiddies The Foods They Need - If We Were Able To Be Born With "Owner's Manuals" For Our Body And Brains - Duplicator Tests - Sexaling With Family And Friends - Massaging The Butt Hole And Shank - Sending Hillary And Obama On Their Final Rides - Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr. Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All The White House Staff, Etc. - A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A Number Of Other Lesbianists - What To Do, Now? - Compliance With The General Terms Of Their Settlement Agreements Persons Who Wish To Participate In The Former Sexaling Program - Qualified Card Carrying Members - Zealot Updated: 23-06-07 Rev.d 20:50 PDT

The Medical Community's Cheap Trick

A cheap trick played on medical doctors and students, untill they meet up with a human cadaver, is the cheap trick or lie that is perpetrated by the medical establishment on students of the medical profession.

How students of the medical profession stay quiet, after learning the truth, I do not know. It is a matter for each doctor to reflect upon, and for each medical student to reflect upon, and come to a reasonable answer for him self or for herself.

In other words, are they going to tell the truth or not. It recently came to my attention that the medical community is foisting, or purposely telling a lie to the public, with regards to the internal organs of the human body.

In particular, a stomach is not made up of twisting, turning, guts, or intestines, that go to one side and then downwards, and then side ways, and so forth, as depicted in this particular picture, of the so-called large and small intestines.

Please see, "Anatomy of the Large And Small Intestines"

http://medpics.findlaw.com/generateexhibit.php?ID=1696&ExhibitKeywordsRaw=Anatomy+of+the+Colon+(Large+Intestine)&TL=1889&A=42409

A similar faked drawing of the tummy tube, or shank, the descending colon tube, which is titled "intestines", along with a faked stomach drawing, by the Lesbianists and their bogus 'medical' establishment, can be found at:

http://medpics.findlaw.com/generateexhibit.php?ID=23&ExhibitKeywordsRaw=stomach&TL=1825&A=42409

Another bogus drawing of the abdomen and the supposed 'intestines', can be found at,

http://medpics.findlaw.com/generateexhibit.php?ID=13860&ExhibitKeywordsRaw=&TL=4294967295&A=42409

These pictures, and all other pictures like it, are totally bogus. There are no guts, bending and twisting to one direction, and then to another direction, that eventually find an outlet at the poop hole in the human body.

Chimps, apes, and monkeys may have these types of stomach 'tripe' that is longish, twisting to one side or to another, going back and forth, and then wrapping or folding down under other tummy tubes, and then twisting in and then moving outwardsly, as chimps, apes, and monkeyes live on banana foilage, twigs, seeds, hard shells, and other difficult to eat, hard, rubbery, plant roughage, of one kind, or of another. Some oselots may have this kind of tubeing, and so may many other animals, but not the human being.

In the human being, there is in reality, no such guts or tripe tubeing, and there is what is called a 'shank'. A shank is the human being's tummy tube, or the desceding colon tube.

Your tummy tube descends from the front right side of the tummy, in the near to upper to middle to near lower area or section of your tummy, depending on the person. Some people, may have their tummy tube, the ejector pipe, also called the descending pipe, a little higher up, than other people. Some people may have their ejector pipe a little lower than other people. That is not significant.

The muscles inside of the tummy, and surrounding the tummy, cause a pushing motion, to eject the tummy food, that has made its way to the back side of the inside of the tummy, and to the lower or middle area, near the eject pipe, on the inside of the tummy. Once your tummy food makes it there, the muscles begin to squeeze on it, and the muscles on the inside and on the outside, squeeze on it, and force it up and out of the ejector pipe, and down a chute, or the descension colon pipe.

The descension colon pipe goes in a nearly straight line, almost perfectly straight, in some people, directly to the out put terminal, which is the poop hole.

The intake for food and beverages from your lips, mouth, to your throat, or food pipe to connect your mouth to the tummy, that connector location is on the top side of the tummy, on the left side

of your tummy, as you face forward. There is a tiny amount of terminal area, that's your stomach area, that is the terminal area, on the top side of the tummy, that is to the immediate left of the intake tube terminal entry way, itself. That means, there is a descending tube from your mouth to your stomach, and it connectes to the left side of your stomach, not all the way to the left, but nearly all the way to the left side of the stomach, but on the top, generally, and in some people's cases, it is a little down, from the top, less than an inch or two from the top.

So the intake tube from your mouth sort of goes in to your tummy, from the front of the tummy, a little lower than from the top side edge of your tummy. The top edge of your tummy is located just about at the same height as your titty nipples are located on the chest. The little inwardsly pointing, dimple, in the middle of your chest, a very large dimple, just above where the rib cage begins to open up and spread apart and where the tummy muscle cavity can be felt, that dimple, or inwardsly pointing cavature, or the caving inwardsly of the chest bones in that area, some times slightly below, sometimes slightly above that point, is where the tummy's top edge is found. The tummy's top edge runs horizontally, more or less, across from one side to the other. It does descend at the outer edges of the tummy, to form a pouch system.

A bogus drawing of the Lesbianists' pretend 'esophagus' for all the med school students to ponder over, and of a pretend tummy, which has the connections on the back side, where they are not located, but on the front side, where they are located, can be found at,

http://medpics.findlaw.com/generateexhibit.php?ID=4599&ExhibitKeywordsRaw=esophagus&TL=1825&A=42409

The tummy does not look like a cashew peanut, like in the drawing. It is a pouch, and it is more oval in shape, kind of like a box, but a little long or rectangular, some may say it is similar in shape to a peanut, or to a raisin, or to a plumb, and it runs lengthwise from one side to the other, with the narrow part of the oval running horizontally. It is nearly a perfect, very slightly long, oval in shape.

The descending colon pipe, your tummy tube, which goes nearly in a straight and almost perfectly vertical, in many cases, direction, to your poop hole, from the ejection outlet port of your tummy, which is on the front side of the tummy, on the front right side, as mentioned above is very long, and in some women, the tummy rests slightly higher up, a tiny bit, to allow for a longer 'shank', or sexaling tube.

What Is The Shank?

The shank, if we look at the opening and entrance to the shank, the butt hole entrance, the shank is a multiple duty, instrument. It is a nearly straight tube, and it allows food to exhaust from the tummy

pouch. It also allows a dick to be placed up into it from the rear upwards, and a dick can be very long, in some cases, and there for, the tummy tube, or shank, is very long, and also, importantly, it is generally straight in most women and girls and in lots of men and boys.

Discoloration Of Sexaling Organs

If we look at the dick, or if we look at the scrotum, we will see it is a darker, slightly discolored body instrument. The vagina is slightly discolored, and so are the titty nipples. So are the lips, the inside of the mouth, the throat inside, and in various other places, depending on the person. The palms of the hands, the undersides of the fingers, the soles of the feet, the toes, the ears, the cheeks, and the underarms of people are all discolored to one extend or another. The discoloration is an indicator of the fact that these sense organs, or love making instruments, are major sexaling instruments. The other organs of the body, are minor sexaling instruments. All of them, are sexaling instruments when you activate them, by massaging them, and by rubbing them, and so forth, and they will begin to shoot off energies, and those energies will purify and holyfy your life and clear up your karma and the karma of the people around you as those energies will shoot out in all directions cleaning up my universe, as they go zinging outwards. The energies will erase your karma, over time, and if you pray with a prayerful minded statement in mind, while sexaling, your karma that is related to that prayer, that needs to be erased, will get erased, little by little. For examply, "I pray that I will be able to have the good health and prosperous life, that will allow me to live, comfortably, and without distress."

Sexaling And Prayer Statements

The negative karma that you have, that would prevent you from living a healthy life, that is also prosperous, and without distress, will slowly, over time, get erased, as you make your statement, every time you begin sexaling, or every time you begin a sexaling session. If your sexaling sessions are going to go for days, say, three to eight days, for instance, you might want to repeat the prayerful minded statement, every eight to twelve hours, to fifteen, to thirty, to fifty hours, or so, to 'freshen' it up, once every so often. The more you freshen it up, the better it will work. The prayer will apply to not only you, but to every one else who is sexaling, if you say, "I pray that I and every one else will be able to have the good health and prosperous life, that will allow not only myself, but all other people, as well, to live without distress." This statement is a bodhisatva minded statement, and it will produce better results. Prayer statements said with others in mind, in addition to your self, produce better results, as a general rule. Why is that? Because we want to purify not only your karma, but every one's karma, and you get extra points for thinking about every one else and their needs, as

well as your needs. Not only your self, but every person who is sexaling, during the time you are sexaling, and during the time, you continue or plan to continue sexaling, as one long sexaling session, will benefit from this prayer statement.

The Butt Hole Sexaling Organ And The Shank Sexaling Organ

The butt hole is also discolored, in all human beings, and that is an indicator that the butt hole is a sexaling organ.

The discoloration of the butt hole entrance, is an indication of the fact that the butt hole entrance is a sexaling organ. If we look inside the butt hole, we will notice that the entire length of the 'shank' is discolored, and therefore, the entire shank is a sexaling organ. Sexaling organs are different in coloration, than the normal skin coloration of the body.

The discoloration is due to the fact that there are a gazillion plus tiny blood carrier veins and arteries, that are very tiny, so tiny, you can not see them with today's 'current' medical microscope technology that is in the hospitals and labs, used by doctors, scientists, and lab technicians. These tiny blood 'capillaries' or fluid flow ductways, are too small to be seen by a doctor's microscope, or by a lab technician's microscope. These fluid flow ductways, or capillaries, are all clustered together, in high densities. When they cluster together, that is for a purpose.

They are clustered together in high densities to allow for fluids to flow to the nerves in that area of the body to feed all the mouths in the nerves of that area of the body. There are clusters of sense nerves that are extremely dense, in all the sexaling organs. Where there are high densities of sexaling nerve clusters, there are lots of fluid flow ductways, or capillaries, and the area of the skin that is visible to your eyes, will show a slight to moderate, to heavy discoloration, due to all the fluids flowing through the area, carrying food and nourishment.

Nerves

Nerves are organs in them selves. The smallest nerve organ is a nerve cell, perhaps. My memories are not very good, so we might find smaller nerve organs, as my memories improve. A nerve cell has all the organs in it, to allow it to function as a normal, living being. That means, it is alive, and it thinks, and it cogitates, or mulls over thoughts, and it considers, for instance, 'What am I going to do, now', and it has lots of thoughts, and it stays busy doing lots of thinking, and by doing lots of cogitating, and by doing lots of communicating with other nerve cell organ kids of mine.

Nerve Units As Living Beings, I.E., Creatures

Nerves, just as nerve cells, form units, and as a unit, they form a living being, or creature, and all of them have mouths, since all my

creatures have mouths, and they all need to be fed.

The sense nerves, the erotic nerves that are clustered together, need to be fed the foods and nourishment that they need to be healthy and fit, so as to be able to respond, to stimulus. They need to eat to be healthy, so that they will then be able to respond when stimulus is applied to that area of the body, where they are located.

Each organ in the body, has a brain, and a mouth, and a stomach, and a poop hole, and a pee hole, and all the other organs they need to survive with.

Some organs, maybe all of them, need to feel comforted by other organs, i.e., creatures of the same kind as they are. Some organs like to not only speak to other organs creatures who are like them, but they also like to snuggle up to one and another, and they get cozy with one and another, all snuggled up, suddenly, before any one new it, pwoop, and they make a baby organ or creature who looks like mommy and daddy.

Organ creatures of course can sexal, because if they could not, they could not make baby organ creatures. Organs can sexal just like human beings can sexal, but they sexal in their own particular ways. They like to sexal, just like human beings like to sexal, and they also go ouch, when some one or some thing pokes them, or pricks them, such as the doctors needle at the doctor's office.

Each nerve cell is built with all the organs it needs to survive, and each organ is built with all the organs it needs to survive. The number of organs in the human body is almost limitless, but not quite limitless, as you can still count them, all, if you have the time.

Brains And Notational Thoughts

Each organ is a living being, or creature, with a brain, and with notational thoughts. Notational thoughts are memo types of thoughts, such as about, 'oh, boy, that sure felt good', or 'golly, gee, I am really bored'.

One notational thought, for instance, that is of use to you, is when you are in need of water, and you begin drinking water, when you get the feeling that you need lots of water, and you get a message to your brain that you are in need for water, because you know you are low on water, and almost out of it, well, the inspirational thought that tells you, "keep drinking, keep drinking, you are too low on water" that is an inspirational thought, that your tummy and its brain is passing on to an area of your conscious mind, where you can then pick it up, and then act on it.

There are many kinds of notational thoughts organs can have and organs can pass on to our 'brains'. Organs, as living beings, also do lots of chit chat with other organs, not only with the organs inside of your own body, but also with the organs inside of the body in other

animals. Brains are brains, and they are very smart, if they are to do the duty they are assigned to do, which requires them to be smart. They are so smart, they spend a lot of their time, communicating and chatting with other organs, to see if every one is alright, and to find out what the latest gossip is. They can do many things, and that is the topic for another time. But one thing they can do is talk to each other. They have their own languages, they speak to each other with. Did you know that? I bet you didn't. If you are a Lesbianist, you may probably know this, as you probably studied about it, in your school days. Some kids, five or six years old, study these things, on planets, where education is up to the standard, that I set it at.

If we understand that brains are in every organ in the body, and some organs, have multiple brains, almost all of them do, and if we understand that they are able to communicate to each other, than we can understand that the vagina is a living being, and it has a brain, and it talks with other vaginas, in other women and in other girls. The dick has a brain, too, and it talks with other dicks, and it talks with vaginas, as well, when a vagina calls to a dick, and asks it questions.

Feeding The Organ Kiddies The Foods They Need

We need to feed the body, many foods, not only tomatoes, potatoes, asparagus, meat, and fruit, etc., but we need to feed foods to our body for feeding the organ kiddies, the organ animals, the living beings, or creatures with brains, called organ kiddies who are inside of our body.

What are we doing when we feed the body? We are supposed to be feeding not only our face, loading food in that tastes good to us, and to our sensibilities, but we are also supposed to be feeding the animals that live in side of us, as well as, we are supposed to be feeding the organ kiddies, who also need food to stay alive. We also need to be feeding all of the other animals kiddies, the living creatures of various kinds, that are living inside of our bodies. Most organ kiddies are on a starvation diet, nearly, and they survive on nearly only water. Some are lucky and get some pee and poopy juices from animals that live inside of our bodies.

Most of the organ kiddies are not lucky, and they languish, from day to day, with nothing to eat, and they hang on, and they do their best to perform for us, but in the end, they are defeated by our not feeding them, and they give out, and give up, and throw in the towel, and say, "To hell with it. I don't care anymore." and with that, they cancel their agreement to work with us, and they say good bye, and they then slowly perish, and as they do, so do we. We perish because we do not feed the organ kiddies in our bodies, and because we do not feed the cell kiddies in our bodies, and because we do not feed the amoebe kiddies in our bodies. If we feed them all, we would not die, and they would continue to live, properously, and progenerate, or give us babies, to take over the jobs of mom and pop, Sr., the first organ

kiddies in our bodies, who want to work with us, and who want to be fed, while they work for us, when mom and pop, Sr. are near the end of their run, that is their work life, and when it is time to call them in to my Epcot Centers for them, for them to get their check up, and repairs that they need, to their brains, and to their nervous systems, and to relieve them of any undue or unwholesome stresses, nervous tension, migraines, and so forth.

You might be thinking, "This is a joke", but it is not a joke. You are completely wrong if you think this is a joke. If you feed the foods that organ kiddies like to eat, to them, they will become alive with activity, and they will work hard for us, and we will feel a new sense of vitality, and we will regain our good humor, to some extent, as it is a karmic issue here, as well, having a good humor, or a pleasant personality, and when it is time for mom and pop, Sr., organ kiddies to pass on the work load to baby Mac, and baby Sarah, organ kiddies, Jr., they will pass on the work load to them, and Poppa and Momma will retire and make their way, with assistance from their kids, and with assistance from my kids, to my Epcot Centers for them.

This is a complex topic to discuss, and I won't try to discuss it in full, obviously, as I am too stupid, and my brain is not working, and I can't remember every thing about it, obviously. But, you should know, that if you feed them the molds animals, the molds fruits and gardens produce, and the funguses they like to eat, and that they enjoy eating, and the other foods that they eat, from fermented mash, made correctly, and from molded foods, and from molded breads, molded chesses, properly cooked meats, and so forth, they will feed on the animals in that food that you prepare for them, and you'll get healthy, and they'll get healthy, and they'll live for three hundred to eight hundred to fifteen hundred years, or more, depending on which ones you are talking about, and they will work for you, with zest and vigor, before it is time to hand over the work load to baby Mac, and baby Sarah, organ kiddies, Jr.

If We Were Able To Be Born With "Owner's Manuals" For Our Body And Brains

We are not born with an owner's manual for our body and brains, etc. If we were born with one, we would be told that if we feed our body properly, the body will last us forever, and we will be able to live forever. This is the norm for the human body. It is not a 'dream' or 'hope', or 'wish'. It is merely the truth, and once you learn how to feed your body, and all of the animals and creatures inside of your body, you will begin to make all the animals and creatures inside your body, happy, and they will begin to work for you, as they were intended to work for you. They are all my worker animals, and they are here to work for me. I have many worker animals, and we will learn about all of them, and we will find those who we need to help us feed our bodies properly, so that we can all live in the body that we were born in, that is meant to last you forever, if your feed it and

nourish all of the animals in it, properly.

If you do not feed my worker animals in your bodies, the nutrients, the animals and the plants animals and the foods that my worker organ animals in your bodies like to eat, that will allow my organ worker animals, and all of my other worker animals, to live with vigor and tenacity, strength and good health, they will not work very well for you, and in time, they will all perish, and so will you. I mentioned my worker animals in the molded foods, molded fruits, molded citrus fruits, fermented beverages, and so forth, that we will be making. They are all there in those foods that we will make, and then use to feed ourselves with, to then help feed all my worker organ animals, my worker cell animals, and other worker animals, that are in your body, and that need to be living in your body, working hard for you.

If you do not feed them the foods that they like to eat, they will not live for long, and they will perish, and die, and that will be that, and you will not have a chance for living more than a hundred or two or three hundred years, in that body of yours, if your karma is good, and if you were not being poisoned by the petro chemical industry, and the chemicals industries, and by the foods manufacturing industries, and by the pharmaceutical manufacturing industries. We will never hear the Lesbianists admit that they are intentionally poisoning us, but they are.

Once you find a way to survive on molded up, wholesome natural healthy foods, with no pesticides, and on water that is not chlorinated, and that is wholesome to drink, and after you learn the abc's of proper eating, to feed every one in your body, as well as you, then you will not die and you will begin to live forever.

The Lesbianists are afraid that you will learn to eat properly and then, when you begin to get your diet together, not only for your self but also for all the animals and organ kiddies in you, and for all the cell animals in you, or cell creatures, who are smart living beings, by the way, you will begin to be able to extend your longevity, and then, in time, you will be able to live forever.

If you stop drinking the poisonous coffee in the office, as I've explained about, previously, the Lesbianists make it with diesel fuels, and with gasoline, and with kerosene, if you stop smoking the poisoned cigarettes, if you stop using the plastics furniture, and other plastics products, if you stop inhaling the gasoline fumes kiddies that cause fibromyalgia, and fumes animals cause the sharp pains in the body as the fumes animals eat up and destroy the organ animals in the body discharging energies or electrical currents, as they mate, and as they sperminate, and vagicate, or eject female animal sexaling juices, like some jelly fish do, and like some deep sea snakes, and worms, that are lit up, with pulsing lights in them, when they mate, do. Fumes animals also cause arthritis, ligaments problems and diseases, and other health problems. If you stop inhaling the plastics fumes kiddies, which also give you fibromyalgia,

arthritis, etc., and kill brain cells, and cause brain rot, Alzheimer's disease, and parkinson's disease, and a number of other illnesses, and if you begin to eat properly, in accordance with the proper rules for diet, that our body and brain owner's manuals would explain about, if we were to be born with these manuals at the time of our birth, then, you will begin to get healthy, and you will begin to live forever.

So, good luck, and do not vote for Hillary Clinton, or any of the other presidential candidates, and if you see them, give them a beaver cheer, some people call it a 'Bronx cheer', and the noise you make sounds like someone farting in their direction. That may sound childish to say, but it is what the Lesbianists deserve as you are being played for a fool, every day of your life, and you should snap out of it, and do some thing about it, as soon as you and your friends can get it together to begin sexaling, in the ways I've explained about.

Duplicator Tests

In a duplicator test, there is one strand of a piece of the body, and you take that strand, and with medical and scientific technologies, you attempt to make a copy of it.

Why do they make a copy of a strand of a piece of a human or ape, monkey, dog, or cat, etc., body?

To test for various possibilities as to who the strand came from and how the strand came from the source, and what has happened to the person, if it was a person, if the person is no longer here to stand in for himself or for herself, in the case of a missing person, for instance.

What is meant by a strand of a piece of a human, etc., body. Usually, a piece of flesh is a good place to start. A clipping from a person's finger nails, can be duplicated, if the sample is tiny enough, and it can be analysed, and then compared with an original shard or piece from a person's finger nail, a known subject's finger nail, and then a match up can either be made, or not be made.

Human blood cells can be duplicated and matched. Human skin tissues can be duplicated and matched. Human organ tissues can be duplicated and matched.

These matching tests are in fact, one example of a organ animal giveing birth to a baby organ animal, or to a number of baby organ animals.

I'm not sure what they call the test, in the laboratory, but that is a duplicator test, in my vocabulary, and it should be a simple test that all county, municipal, and other police medical technical labs, forensics labs are capable of performing.

This example of a matching print from the one strand of a piece of the body, is an example of organs animals, giveing birth to baby organ animals.

Red blood corpuscles, are often tested, in this manner, I believe. A corpuscle is an organ animal, and it will give the same results, and you can make baby blood corpuscle organ animals.

A high school, or jr. high school science lab technician or teacher, or in some school labs, including jr. college science labs, and technical labs at medical technical schools, teaching assistants, should be able to perform this test as it is a simple test to learn how to perform, and even off duty police officers, are taught it, in their free time, for fun, or for advancing their career. Licensed Practicing Nurses (LPN's) generally know about this test, and so do all doctors as well as your general medical school student, and two year college, or four year college, nurses course students. Botanists know or should know this test, and there are many professions where in this test is common, such as in paleontology, the study of human remains, bones, and so forth. I don't know what people on this planet, understand a paleontologist (Note: 'paleo-entologist' I think may be the correct spelling, but I'm not sure) as, but in my vocabulary, as it is comming back to me, a paleontologist explores and investigates old bones, fossilized bones, old grave sights, and so forth.

Elementary school students, and maybe some kindergarden school students, in advanced kindergarden schools, such as in Japan, and in Europe, and in different countries around the world, can do this test, if their science lab teacher lends them the technical books, and tools to take home, study, and then show the family and parents, how a duplicator test is done. It's not a difficult test to perform, if you can read, and if you know what a beaker is, and so forth.

This will give you a start for the search for proof as to whether or not there are organ animals in the human body, and in all animal body's and in all living being's bodies. It will provide proof that organ animals, once you've identified them, can in fact give birth to baby organ animals.

There are a number of types of duplicator tests, lab technicians perform, in their day to day job routines, in medical labs, and the duplicator tests are generally for making comparisons, of one type or another, or for one reason, or another. They all give the same results, they provide you with proof that organ animals do exist in the body, and that organ animals do make babies.

Sexaling With Family And Friends

Sexaling with your family, relatives, trustable neighbors, and so on, will help you to begin to erase your karma, if you begin your wholesome, purifying, and holyfying sexaling with your family, relatives, kin, trustable neighbors, and others who are trustable. As you erase your karma, little by little, you will begin to get better

karma, and you'll begin to be able to get rid of these Lesbianists who make fools of all of you, and who toy with you, one life after another, as you go into my Epcot Center, and then come out again, as a tummy baby to a tummy mommy and to a tummy daddy, on a fairly predictable basis, meeting up with your former friends and colleagues, over time, and then going through the six, or ten, or twelve, or forteen, or sixteen, etc., years of schooling, each time you come out, to lead a very short life span, with, once again, all of your organ kiddies and other animals and living creatures in you, nearly starving to death, the whole time you are out here, with your friends, playing, golf, swimming, playing tennis, football, entertaining the Lesbianists, and so on, until it is funeral time, and then back, once more and into my Epcot Center, until a new tummy mommy and a new tummy daddy, are waiting and ready for you to come out again.

This is not a joke, I need to repeat, and you should start thinking about doing something to bring a stop to this abuse of your organ animals and other living creatures in you, and to bring a stop to the abuse of you, by the Lesbianists who will not tell you how to do any thing that is good for you and that is good for your health.

Massaging The Butt Hole And Shank

If you work massaging the butt hole for a few hours, fluids will begin to form, and the tissues of the shank, and of the butthole, will become more pliant. They will become stretchable, and they will, after a number of hours of massaging the butt hole, and the inside of the butt hole, little by little, as you insert a dick up the hole, as it gives way, and becomes more pliant, after a few hours, or so, it will soon be able to become opened up completely, and a dick can then be inserted and the shank then becomes a sexaling tube.

On the end of the dick, there is a 'pooper scooper', or head level scoop pipe. The head level scoop pipe is the peculiar shape of the dick at the tip of it. This shape allows you to insert the head of the penis into the butt hole, and then take a wee wee, and then mush up all the food that is stuck in the cavity, and after a little mushing up of the food in the tummy pipe, or shank, you can then begin to scoop it out, little by little, with one dick shovel head, after another.

After seven or eight dicks, to twelve to thirteen, or so, on the job, pumping, and peeing, and scooping out the poop, and ejaculating, as well, you can eventually scoop out most of the poop from the shank. Some may remain near the top, so a few more pee pee's into the butt hole, will help wash out the tummy tube, and it will become clear and free of digested food matter.

The large and small, i.e., the meaning or intent of this paper, or note, is to let you know that the poop hole is a sexaling organ, and that the poop tube is a straight tube, and not a twisted up, bundled up, chimpanzee, or oselot guts piping, or bear guts piping, or horse

guts piping, or pigs' guts piping, or cows' guts piping, as the medical community, would like to have you believe, along with the hoards of bible thumpers, who colluded with the Lesbianists of the medical community, to keep you in the dark ages.

You are being played for a fool, every day of your life. If you can allow the Lesbianists to make a fool of you, every day of your life, and if that is alright with you, than go right ahead, and play their game, and let things stay as they are, but if you are not willing to allow them to make a fool of you, then you had better get busy, sexaling, and so forth, as I've already told you what we need to do, to help bring about the changes we need to make.

Sending Hillary And Obama On Their Final Rides

A vote for Hillary Clinton for president is a vote for stupidity, on your part. A vote for Obama for president, is a vote for stupidity, on your part. Now why doesn't somebody kill Hillary Clinton, or Obama, or both. I just do not understand. Do you? I don't.

Next time you see Hillary, you can ask her if you can open up the front of her chest cavity, and take a look inside to see if she has a shank, as I described it, or if she has a twisting and turning, animal type set of guts, like many animals do. I think you'll find that she has a 'shank', and not a twisting, turning, animal set of guts.

All human beings have shanks, and not one human being has a set of 'animal' guts. Human beings have shanks for fuckaling, that is, butt fuckaling, but no one, except the Lesbianists, know about it, and as a result, no one ever thinks about butt fuckaling, as a type of sexaling enjoyment, and a sexaling past time.

Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr. Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All The White House Staff, Etc.

Well, I have told you about many bombs you can make, on my web site, and I suggest you begin to think more seriously about taking out Hillary's cavalcade of automobiles, next time she is riding through Washington DC. Or the next time you see Mr. Obama, please consider blowing his cavalcade of cars and limousines, up and out of the upper solar atmospheres, with the bombs you can make, as already explained about, in my notes, on this bulletin board.

After you blow them up into bits, and pieces, they will be fine, as they will soon be coming out of my Epcot Center, as tummy babies, and they will be two less threats to the ordinary and normal people on this planet, for some time to come.

A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A Number Of Other Lesbianists

Before you blow up Hillary, find out if she is with us, on this, or what. I think Mr. Obama is not with us, yet, but it may be the case that Hillary Clinton, along with a lot of her friends, is now on board, and she is hoping to set sail with the rest of us, but is not quite able to break away from the Lesbianists' and their organization, since she has been a friend with them, and a member of their organization for umpteen millions, billions, trillions, and zillions, plus years, since long before they ever even came to this planet, to settle it. These people, Hillary Clinton, and a number of her friends, are ready to make the change over, but lots of Lesbianists are not ready to make the change over, and so Hillary Clinton is kind of stuck, and so are all the other Lesbianists, who want to make the change over, and who want to say good bye to their former organization.

In any case, this planet is crawling with animal people of all kinds, as I've mentioned, and it is a very unpleasant situation, and the Lesbianists know this, as most of their membership has already been eaten up by animal people, and there are many types of animal people. Many of the animal people who ate up the Lesbianists below ground, are walking around, as they imitate, or take on the form of human beings, after they eat one. Not many of the original Lesbianists are still alive, down below the surface of this planet, in their underground cities, as I've recently learned, as most all of them, close to ninety nine plus percent to nearly one hundred perecent of the Lesbianists down below the surface, have already been eaten up. There are still a lot of Lesbianists down below us, below the surface, but compared to the numbers of them who were there, before, there are fewer, now.

What To Do, Now?

I thought my kids were ready, with an underground system of 'safe harbors', but it seems there is a delay, and I'm not sure when the delay will be resolved. Until it is resolved, I guess we are stuck where we are. So, the only thing to do is to get the government to make the needed changes, and to step up to the microphone, and denounce the Lesbianists organization, by telling every one that it exists, and that we will now build a one world, government. When the politicians decide to do that, and when we begin building a one world government, then maybe we will begin to see some resolvement to this situation.

I have some more ceremonies to do, and I have a lot of time to wait, till we see a resolvement to this situation. The additional ceremonies will assist us in making a safe harbor, as far as I have heard, that is fully integrated, and that has all the protection and safety systems that will be needed. All the different components to the fully integrated system, for covering our immense universe, all at the same time, are not available, yet.

There is a lot to learn, about who else lives in our universe, and about where my kids live, and about what my kids do for me, keeping my universe running for me, along with a lot of other information, for

you to get and read, and then understand, about my kids.

As soon as the local, or federal governments around the world release the software that will allow people to upgrade to the 'Managing My Universe' software upgrade, from the databases, that are located in the underground bunkers the Lesbianists used to use when they first arrived, and when they were in the 'sexaling for a living' program, which all of them were in, when they arrived. These databases are also located on other planets where there are bunker systems, and where there are communities of people, who are in the 'sexaling for a living' program.

Also, once the 'Managing My Universe' program software is released, and once people start using it, and once they set up their own network, that it will run on, and once enough people are running that software on their computers, we can have a partial soluition to the problem of the animal people, as well as a partial solution to dealing with Mormons, and Clerics, and Protestant leaders, who believe in "Jesus Saves" and other such useless nonsense.

I think the Jesus Saves group, i.e., Christianity, the Mormons, Protestants, Lutherans, Catholics, Presbyterians, and so forth, is built on Islam, and on Judaism, or rather, on one of the schools of Judaism, plus maybe some other things, made up, or grafted from other religions that were primitive religions, such as Voodoo cults, and worship of the dead cults, as well as other cults, and they were all squished together, and the result was, "Christianity", but that was after all of my teachings were clipped out of the two above mentioned religions that I had taught.

In any case, not a one of them has a clue that sexaling is a 'purifying' activity, and women and their sexaling bodies are like 'purifying' engines, or washing machines, as I've mentioned before, and men and their sexaling bodies, are also capable of becoming 'purifying' engines, and washing machines, though we all have our karma, and it will be a while before we erase enough of our karma, to make a difference, for some of us. That means, some people are better able to sexal than others as their karma for sexaling is better for sexaling than the karma for sexaling of others. We have a lot of karma to erase before we all begin to pick up enough steam to get any where, sexually speaking.

I think that is the general situation, for most, but there are some people who are more gifted than others, and there are some people who are, when it comes to their sexaling capabilities, generally speaking, fine.

With the use of aphrodesics, fruits that we can grow, that must be taken off the 'banned' foods lists, vegetables, nuts, and other foods that also are useful aphrodesics, that must also be taken off the banned foods lists, we will be able to make better progress. Sessame seeds can mold up wheat bread to make a nice aphrodesic, from what

I've heard, and I will give it a try, one of these days, as I'm busy, molding up a few other things, first, sort of for experimentation, as this is all new to me. Peanuts supposedly, might be aphrodesic, once you mold up wheat bread with them. I believe they have minor pain killing properties, as well. Dark green garbanzo beans, sold in Indian food markets, also mold up wheat bread and are useful as aphrodesics. White bread is too poisoned to consider for use. Please use only whole wheat bread, or a bread of fine quality. Do not use white bread or normal white french bread, as the flour used in making them is treated with bleaching agents, that are poisonous.

Compliance With The General Terms Of Their Settlement Agreements

In any case, we need all the laws changed, as I've mentioned about, before, and we need the governments to form a united, single planetary government, and we need every one to begin to get the information they need, and the assistance they need to begin to cooperate with each other, in science, and in agriculture, and farming, etc. We need to ban pesticides, the use of petro-chemicals in the manufacturing industries, the promotion of natural fibers, and natural oils for manufacturing, and the switching over to non-polluting, hydrogen based technologies, and so forth.

We also need the volumes of Greek literature released, as well as all the other literature, that needs to be released, that the initial settlers of this planet, were given, to use to set up their planetary government, with.

When we start to see that these and all the other neccessary steps are being undertaken, in an effort to accomplish them, we will be in a better situation to begin to see a resolvement to this situation. The Lesbianists do not like to be forced into doing things, but in this case, there is no other way of getting these things done, and so if we need to force them to get them to move off their fannies, and get their butts in gear, than we will have to do just that.

We need the Lesbianists, and all the other groups of people on this planet, who legally, or rather, legitimately settled this planet, but who are not in compliance with the terms of their settlement agreements, get into compliance, and the sooner they get into compliance, the sooner we will have a resolvement to this situation.

Persons Who Wish To Participate In The Previous Sexaling For A Living Program

I have talked about the previous sexaling for a living program, that people were signed up with, a long time ago, when they first settled this planet. I mentioned the underground bunker systems, that my kids still keep for eligible card carrying members. I suggested that there might be people who died, and after they came back from the Epcot Center, they no longer knew any thing about the 'sexaling for a living' program, that they were affiliated with, and they forgot that

they were a valid card carrying member of the program.

Even though these people, may not remember that they were once in the program, since they don't usually bring that information with them, when they are tummy babies, in mama's tummy, these people, if they wish to get back into the 'sexaling for a living' program, that they were once a participant in, they may write a statement, and state that they wish to get back into the 'sexaling for a living program'. They need to sign it, and press their energies into it, just as I explained, about, before. For example,

Affidavit

I, ____name____ would like to get back into the sexaling for a living program, that I was an active participant in, previously, and that I continue to belong to, as a valid card carrying member.

Signed: (signature)
Date: (Date)

Then, press your finger, or thumb, or elbow, or toe, or nose, or lips, or palm into the paper you wrote, above your signature and date area, and make sure you press in your energies, as well as you can, and that should wake up my kids, and get their attention. When my kids have verified that your request is legitimate, they will buzz you in, or rather, teletransport you into the underground bunkers, that still exist, in many places, on this planet, and under the surface of this planet. These bunker systems exist on other planets, as well, and so every one who is qualified, no matter where they are, and no matter what planet they are on, can get back into the program, so long as my kids authorize and approve their request for entry into the program.

This will get you started. You have to be certain, that you wish to start off, again, and that you are sincerely interested in getting back into this program, to sexal for a living, in accordance with the rules and guidelines of the original program.

Once you are in the original program, now as a participating member, you can begin sexaling for a living, and you can also, begin to study about the new 'sexaling for a living' program, and the 'managing my universe' program, and the other programs that are now available, in the Gurkian Age. There are introductory courses for people who are not familiar with the program, and your questions will be answered in the seminar like introductory courses.

Once you decide to join with one or more of them and once you decide to get into the Gurkian Age Religious Revolutionary Movement, and then begin sexaling for a living, as you get fit, and healthy, by your participation in these and other activities, as well, such as the club activities, as I've mentioned about, before, so that you can sexal more adequately, and robustly, for, eventually, days, then weeks, then months, then for years on end, without tiring out, too much, and in between sexaling activities, you will have lots of other activities,

such as the club activities, to vary the pace of your life, to make it more interesting, and more engaging, by meeting with lots of people in the clubs, and by learning about these people, and by sexaling with them, once you've decided you would like to join, then you can switch over to the new programs, in the Gurkian Age Religious Revolutionary Movement, and get started when the facilities for them, are constructed by my engineer kids, and by others of my children, who will be helping them.

When we have all of the facilities needed, the new programs will open, and you can switch over to the new programs and my kids will help you with the paper work to transfer over your membership to the new programs, in the Gurkian Age Religious Revolutionary Movement.

Qualified Card Carrying Members

Some of the people who I've mentioned before, such as Jodi Foster, Jennipher Lopez, Madonna, Angelina Jo-li, Jack Nicholson, Angelica Huston, many actors in the New York actors' guild, many members of the west coast actors guild, and many members of actors guilds around the world, and also, many members of dance troups, and dance guilds around the world, singers, musicians, entertainers, members of the military, members of law enforcement agencies, and so forth, many of these people, and others, as well, are qualified as valid card carrying members of the original sexaling for a living program, that the initial members and follow up members of the out bound programs for the settlers to this planet, were all a member of.

Even if you do not think that you could possibly have been a member of one of those out bound settler's programs, you may have been one, and if you write an affidavit, in the form as I've mentioned above, you may find that in fact, you were a member of the out bound program of settlers to this planet, or, you may find that you were a member of one of the other out bound programs, to other planets, and you may find that you are still a qualified, card carrying member who is entitled to rejoin the sexaling for a living program, that you were once a member of.

How is this possible? How can you still be a valid member, after all this time? Well, it is just that we need to get you started, and so these facilities, the underground bunker systems, that I've mentioned about, before, are there, and I was told by my kids, that you can make and sign a statement, or an affidavit, in the manner in which I mentioned, above, and that will be all you need to do, to get back into the program, you were once in. We are extending the time limit on the previous sexaling for a living program, as a short term measure, to help get things started up, again.

Zealot

Joining the original program, applies to all valid card carrying members, whether they currently know they are with an out bound

settler's group, or not. That means, that Ms. Hillary Clinton, can get started up, again, as the time limit on the program has been extended, and so can Mr. Bill Clinton, and so can Chelsea Clinton, and so can all of the other people, who prefer to consider them selves as 'radicals', and they prefer the term, 'Zealot' as in, a person who has a lot of zeal for living, to the term, 'Lesbianist'. So when you see some one you might recognize as a possible 'Zealot' it is polite to use the term, 'Zealot', and not use the term, Lesbianist, as 'Lesbianist' has too many negative feelings attached to it, and people might start using it as a way to make others, angry.

You do not get points, for starting fights, or for getting other people angry at you, for teasing them, and so forth. So, let's all behave, and let's all get into the program, those of you who are eligible, and let's go from there. If you have a friend, who might not be eligible for the program, you can make an application to allow the person into the program, and then my kids will approve it. The person will then get accepted into the sexaling for a living program for the out bound settlers.

Captain Off The Bridge.

What Is Tin

Tin ore is a metal ore, and it is found in cassiterite, as listed in many books, and it is also found in iron pegmatites.

Iron pegmatites are its chief source for supply of this mineral ore. It is like gold, or barium, or silver, and it is found in many pegmatites.

What is barium? It is a mineral that is found in steel ore, or iron ore, and it is a tough metal, and it is very strong, with great tensile strength.

What are pegmatities?

Pegamatites are large stones that contain mineral ores.

A pegamatite ore stone can be found in silver deposits, and in gold deposits, and in many types of mineral deposits.

Pegmatites are generally found with quartz, or a type of quartz, that is a pearly white in color.

It is a cluster of ores, of various types, and the ores can be any thing from silver, to gold, to iron, to boron, or cadmium.

What is boron?

Boron is a chief component of the metal industry, and it is used for making steel. It is found in iron deposits, and it is also found in gold deposits. Boron is a chief component mineral ore found in iron ore deposits.

What is cadmium?

Cadmium is also a chief component of the metal industry, and it is found in large quantities, when found with silver ore, and with iron ore, and with gold ore, typically. It is a shiny grey ore, and it is very useful for making steel stronger.

The processes of melting tin ore out of cassisterite, is a difficult process, but the Lesbianists use it to help confuse people about what tin is. Tin is chiefly found in metal deposits, or metal bareing loads, where there is much iron ore, and steel ore.

Steel ore is similar to iron ore, but steel ore is stronger than iron.

Iron is a little brittle, and with out the use of steel ore, and with out the use of other ores, to stiffen it up, iron ore is a poor choice for durable, pots, and durable cast iron statues as it will fragment, very easily, and it turns to dust, if scraped with a strong hardened steel knife blade.

The home hobbyist, or workshop metal smith, as seen on PBS, the small sized smelting industry, as seen in a recent Las Vegas PBS program that touched on metal smithing, makes a big deal out of white metal, and that is iron, basically, the real brittle metal that comes in through the metal smith's doors from people who own statues made of iron. That brittle metal, if scraped with a knife, will start to shatter, and fall apart, and the metal smith was saying, he could not weld any thing to it, as it would just keep coming apart, layer after layer. That is iron ore, and it is different from steel ore.

I suppose the Lesbianists' made up the periodic table of elements to help confuse scientists, and it does not jive with reality, and the

metals animals minerals animals, elements animals, and other animals, that we have in our environments. The Lesbianists periodic table of 'elements' does not help to describe the many types of 'elements' animals and other animals that we find in our environments, under the ocean, in the forests and jungles, under the ground, or in the deserts, and so on.

How Many Elements Animals Are There?

There are so many elements animals, you will take many years to study about them all, if you decide to study in depth about them. Maybe it will take several hundreds of years, to learn about some of the things about them. If you wish to study about all the mineral animals, metal animals, elements animals, and other living animals that are in my many universes, it will take you a far greater amount of time to study about them all.

We will have courses for you to study about them, once we set up our new civilization, and once we get around to setting up the many other new civilizations, that will all be patterned after our civilization, that we will be setting up, shortly, with the cooperation of the Lesbianists, the Zealots, and their many other outbound planetary settlement groups radical friends.

New Sciences

Elements animals are many types. There are thousands, and millions of elements animals, if not more, maybe many times more, into the kazillions, plus many times more, I think.

Just like animals on the ground, or in the ocean, or in the fresh water lakes, or in the sky such as birds, or in the lagoons, or in the swamps, and so forth, there are untold, countable numbers of different animals.

However, the elements animals are very far greater in number, than the animals we can see with our eyes.

Animals of all sizes, and some of them are very tiny, exist in huge numbers, all throughout my universe.

Tree animals, and plants animals, we learned about recently, the drafts babies, and the wedger mama's, they are in each and every plant, and they are different from every other type of plant animal.

There are quite a large number or plants, and flowers, and bushes, and sea weeds, though we don't see sea weeds too often, or kelp plants, but there are lots of underwater plants, but perhaps not as many as above ground plants, as we have destroyed our environments, and in the ocean, the oceans are so polluted, not much grows in them, any more.

Elements animals are very large in number. So are molds animals. Molds animals are very large in number, but who is there more of? I don't know, but maybe with all the different types of molds there are, there

may be more molds animals, than there are elements animals, but it is a close call, I think.

But maybe not, as there are so many types of animals in molds, maybe the animals found in molds, are far greater than the number of animals found in elements.

Anyway, I suppose molds animals, if we look closely at all the different types of molds there are, with a microscope, will far out number the number of elements animals.

Never the less, there are a far greater number of elements animals, than the Lesbianists are going to let anyone know about.

Why is that? It's because they do not want to educate people about the real world we live in. They want to keep us dumb, and stupid, so they can laugh at us, or at least, as dumb and stupid to them, anyway, so that they can laugh at us.

Well, it is a pretty unpleasant situation, here, because we have to learn what science is, and we have to learn the real sciences, and not the phoney sciences the Lesbianists teach.

My memories are not good enough to even begin to teach any thing, but any way, we need some Lesbianists, such as George Bussey, or Clint Eastwood, or Morgan Freeman, and Liz Taylor, and Mila Jovovich, and Mrs. Barbara Bush, Jr., and Mrs. Barbara Bush, Sr., and Mr. George Bush, Sr., and Mr. Ronald Reagan, and Mr. George Bush, Jr., and their radical friends, to teach us the real sciences, along with the rest of the Lesbianists, or Zealots, all of them.

Not a lot of them will want to comply, with that, but we can get some of them to comply, if you make friends with them, and then invite them to your houses, and sexal with them, and make them your best friends, and your sexaling partners. The longer you remain friends, and the longer you sexal with each other, the more compliant they will become over time.

That's the best way to get the Lesbianists, or Zealots to become your friends and then have them teach you stuff, about molds, and science, that you didn't know about, before. As you learn about science, you will learn about making molds, using different methods, and then you can learn how to feed your body, and then you can learn how to feed all the organ animals in your body, a proper diet, and then you can live forever.

If your organ animals all get the foods they need, you will have many happy animals inside of your body.

Professional Moldists

Lesbianists are all professional moldists, and they all have the capability to teach people how to mold up any thing that is worth molding up. They study for millions, and billions of years, and even

longer, in some cases. They get their professional degrees, and then they qualify for the outbound settlers' program, and then they go off to settle a new planet, that has not very long ago, recongealed, after it was last smashed apart by a passing sun, or large planet, traveling at a very high rate of speed as it smashed into it, or as it smashed into something, such as another planet, or even a sun, nearby.

That can be very catastrophic, and not many people will survive, and many planets in the vicinity, will shatter to pieces, when a sun or large planet is hit by direct impact, by a large size planet, or fragment of a large planet, or a sun, or fragment of a sun, traveling at a high velocity, near or even past the speed of light.

The shock waves that go shattering out, in wave after wave, will destroy every planet and sun, for a long ways around.

This happens, some times, and the planets and suns and moons, are reduced to dust particles, and after some time, they begin to recongeal, as they go spinning around due to magnetic waves that affect them. After spinning in various formations of circular movements, they eventually recongeal into numerous planets, and many different sized suns. Lots of moons also form, and you have the birth of a lot of new planets, that need settleing.

We always send out people to settle the new planetary systems that need settling, who are most qualified, to establish and lead a new civilization, that they must construct, as a part of their agreements, for their being selected to settle the new planets.

This is how it is typically done, and so we get the best and the brightest, and after their certification, they go out to settle a newly formed area of planets that are habitatable.

We send out many groups, one after another, of highly qualified people. Hulk Hogan was one of those people, who came in a different group of people, but he is friends with the Lesbianists, and he supports, more or less, what the Lesbianists are doing. There are a lot of Hulk Hoagan's friends, who also came and settled this planet, in one or more of the out bound planetary settlement groups.

We need Mrs. Barbara Bush, Mr. Hulk Hoagan, and all of their friends, including Hillary Clinton, and Mr. Obama, to get into compliance with the terms of their agreements, that they initially signed onto, and penned their names to, so that we can get further aide from my children.

My Working Children And Where Are They?

My working children take care of the support work, once the settlers in the out bound settlement groups are in agreement with the terms of compliance, of their out bound planetary settlement program.

How this is done, takes some explaining, but it is fine to leave it as it is, for now, as it will take a lot of explaining to do, to let you know exactly how every thing in my universe is set up, and where all my kids are living.

There are multiple dimensions to this universe, and I weaved together this universe, in such a way as to support the activities of my kids, and at the same time, support the activities of other groups of my kids, living in different dimensions, and at the same time, support the activities of us, living here, in this large universe of ours. This is the central area for us to live, and we have a different job, as it turns out, and that is to purify our universe that we live in, for eternity, so that we can all live in all the universes I have made. There are many universes, too small for you too see, as you are just too big to possibly see them.

I also made many dimensions, and weaved every thing together, in such a way as to support the religion that I am now going to teach to you, over time, and that you are all going to learn about. You can decide for your self if you wish to practice my religion or not, but your practicing my religion, is essential for us to have a nice place to live in, for eternity. That also includes all of my kids.

Different Jobs For My Different Groups Of Children

We have a lot of different jobs to do, my kids, and you, and to keep every thing running smoothly, we must practice my religion, that I am now begining to wake up to and learn about, as I come out of my condition of amnesia, and that I am now begining to practice, in my apartment.

This is how I planned, it, with me waking up, and coming out of my amnesia, and then, over time, introducing my self to all of you, as you all begin to practice my religion.

We will be here for eternity, and it is our job to purify our universe, and to erase the karma, that is a continuous problem, for all of us. There is much we must understand about how my universe is built, maintained, and run or managed. All of my kids make karma, and to keep this universe running properly, we have to divide the karma up, into manageable sizes for each one of us to bare. We are in the best location, here in this universe that we live in, and it is our responsiblity, because we it is our job, to keep our universe pure by practicing my religion.

Advantages To Living In This 'Central Bus Station Terminal Building' Universe

There are lots of advantages to living in this universe, the 'Central Bus Station Terminal Building' universe, that my kids do not share with us, as they live and work in their many, tiny 'Bus Station Terminal Building Support' universes, to support what we are doing, in this 'main' universe. There are lots of things that you can do in this 'main' universe, efficiently, and effectively, that you can not do as

well at, in the tiny universes that my kids live in.

The list is long, but one thing is, taking karma, and figuring out how to deal with it, and then dealing with it, efficiently. Another thing is, balancing out karma. We need to balance out karma, to keep every one and every animal alive, thriving, and well, and we can effectively balance out karma, in this 'main' universe, better than in the tiny universes that my kids are living and working in.

With my religion, that we will begin, soon, to accept and practice, some of us in our universe, and in time, more of us, and with my kids practicing my religion, along with us, but in their support network of tiny universes, and more needs to be explained about the support network of tiny universes and what my kids are doing, as they work in them for keeping things running smoothly and harmoniously, we will effectively have a way to balance out karma, much better than ever before.

Practicing my religion is also good for erasing our karma, and we can more effectively erase our karma, and keep things running smoothly, for our 'main' universe, as well as for all of the many support universes, that my kids are living in and working in, and that we need integrated with our 'main' universe, to allow us all to live in this very big universe of ours, which includes and is central to all of the other many 'tiny' universes and central to all of the other living areas, that goes on, beyond the walls of this universe, in all directions for almost nearly infinity for all practical purposes, that I have for all of my working kids to live in and work in, supporting what we are doing in this universe and supporting, in an inter networked and inter connected manner, what they are all doing, in their universes, and living areas, as well.

My human being kids all have jobs, and so do all my worker animals, and I have lots of working kids, and I have lots of worker animals of all different kinds.

You and I, who are in this main 'Central Bus Station Terminal Building' universes, are the only ones who do not have jobs assigned to us. Therefore, we are all going to work, forever, from now on, at practicing my religion, and this will be our primary job, for keeping our universe running, and for keeping all of my kids universes and living areas, running in proper order, as we erase the massive amounts of karma that need to be erased and as we balance out the massive amounts of karma that need to be balanced out.

This is a difficult and lengthy topic to discuss, and so I'll have to leave it for another day. Sorry.

In any case, we all must have a job, all of my kids and I, and now, of course, you are all going to join my kids, whether you like the idea of it, or not, and begin working for me.

Getting Into Compliance Of The Outbound Settlement Program

Mrs. Hillary Clinton, Mrs. Barbara Bush, Jr., Mrs. Barbara Bush, Sr., and all their friends are now going to have to get into compliance with the terms of their aggreements for the outbound settlement program. Once they do that, we can begin to get things started, for the rest of eternity, with you practicing my newest religion.

This religion will take the best from each of my earlier religions, that I taught, and combine all of the best of them, into this one. There are also some other special features to this religion, and we'll learn them over time.

In any case, we are going to place women in their rightful place, above men, and we are going to place men in their rightful place, below women. That's one of the main things that we are going to achieve with this new religion. It was never a big issue, before, in I think maybe most of my religions, if not almost all of them, where women stood in relation to men.

Anyway, we are going to get an understanding of the fact that there are two races of people, and one of them is the female race, and one of them is the male race.

That's one of the primary things, that we are going to get straightened out, now, with my religion, with out ever getting it confused, again, for the rest of eternity.

In any case, we need all of the friends of Hillary Clinton, Bill Clinton, Chelsea Clinton, George Bush, Jr., Barbara Bush, Jr., George Bussey, Mila Jovovich, Bruce Willis, and of Hulk Hogan, and of all of the other people who came in the original outbound planetary settlement groups, who are still here, and still alive, and who still remember that they all have planetary settlement agreements to get into compliance with.

Unless they do that, there is not much we can do, except wait around until they finally do decide to get into compliance. They must then take the neccessary steps to inform every one, about the facts of this situation.

The Planetary Government And The Laws For The Citizens Of This Planet

Until they do that, we can not get much work done, as all the laws, and the way the societies on this planet are set up, will not work for us. Nudity and nakedness must be permitted, and so must public sexaling. All forbiddance laws must be dropped, and all laws on behavior, and the types of plants people can eat, and so forth, must be all dropped.

The sets of laws that are the basis of the outbound planetary settlement programs must be then instituted. The governments that the Lesbianists have set up, must be dropped, and one planetary government must be formed with those laws as the foundation for all of the citizens of the planet.

Those are the first steps that we must take. After that, we will get and have the needed arrangements, to set up my religion, globally, so as to make it accessable to every one.

We are also waiting on the release of the software and operating system, that I released to the FBI, through their twenty four hour a day, audio and video surveilance of me, which I've talked about, before. When that software and the operating system are released, we can begin the 'managing my universe' program, and the 'sexaling for a living' programs, that will then be instituted, after the Lesbianists and their friends, get into compliance with the terms of their agreements.

Once they get into compliance, and once we get the software from the tapes of the video surveilance, we will be able to institute the 'managing my universe' program, and the 'sexaling for a living' programs.

Until then, there is not any hope for any meaningful change. So, until then, please make friends with the Zealots, or Lesbianists, and their friends, and become good sexaling partners with them, and get them to teach you more about the real sciences, and about molding sciences, etc., and make good relations with each other. It may take some time to get their attention, and to get them to begin to accept your offers and invitations to your homes, or to their homes, on occaision, for sexaling sessions. After sexaling for several weeks, non stop, they will all become more pliable, and more compliant, and they will begin to loosen up, and then open up and talk about things, as you all begin to learn to trust each other, and to treat each other with care, consideration, and respect. You can then begin to build on your understanding of each other, and your relationships with each other, will begin to blossom.

Sexaling Professionals

The Zealots, and their friends are professional sexalers, so they can teach you many things and secrets about sexaling, that you may not know about. You will make good bed partners, and after some time, you can learn lots of things. There are cures for herpes, of course, and for genital warts, and for all venereal diseases, and so forth. These Zealots, the Lesbianists, know all about them, as they had to study all of that stuff, to get qualified and certified for the outbound planetary settlement programs. You will also be able to learn proper diet techniques so as to be able to feed your body, and all the organ animals, and other animals, that are living in your body, and that you need to feed. You can also learn proper skin care, health care, and body hygene.

Wedding Arrangements

Currently, the way things are set up, with one person, a male, and the other person, a female, getting licensed to marry each other, will not work, under the new system. Thus it is neccessary to get into

compliance with the terms of the outbound planetary settlement programs, so that the new laws will allow for multi person marriages. Multi person marriages, I discussed, before. Women and girls need multiple men and boys to sexal with, properly, as women and girls are very capable sexalers, once they learn how to sexal properly. Multiple person marriages will allow for mulitiple women and girls, and multiple men and boys, to marry each other. The current laws must be dropped, and the current governments must be disbanded. After that, the new government and the new laws will allow for multiple person marriages. Once multiple person marriages are allowed, after the new government is set up, then the sexaling for a living programs, will be instituted, as a part of the compliance terms.

Informing The People Of This Planet About The Terms Of Compliance

The Lesbianists need to inform every one about what the terms of compliance are, and they had better get to that, soon. They must then, with their many friends, who came after them, or along with some of them, as they arrrived on this planet, by space carrier, or space ship, begin to get their Lesbianists friends in all the governments of the world, and their other friends in the governments of the world, to comply and participate in setting up the one world planetary government.

The software and operating system software, have in them, access capabilities to access data bases, to down load all of the information, that is needed for every one to learn about and to begin participating in all the new programs.

Building The Infrastructure, And The Needed Facilities, Etc.

Once you begin accessing the databases, and once you begin to study, and learn about the new programs, my kids, who work in other universes, and in other dimensions, will then begin to build and set up the infrastructure, housing, food production facilities, medicine production facilities, recreational facilities, academic facilities, hospital facilities, prison facilities, and so forth, that will be needed to further advance the programs every one will be required to begin and will need to begin to participate in.

Once we get to that point, we will begin to be able to have a stable society, with all of the new technologies that will be provided for security, and personal safety.

Molding Up Bread And Metals Animals, Etc.

I said, before, that you need only a square inch or so of metal in each one gallon of bread you are molding up. That may be a minimum, but it is better to use more. If you are using a plastic container, you can line the bottom of it, with aluminum foil, and you can line the in side walls of the container, up to one half to two thirds up towards the top, for better results.

Some molds animals like silicas. Some like quartz. Some molds animals like tourquoise. And lots of them, like various mixtures of minerals and metals, and elements animals, as well as other animals, we do not know much if any thing about, who are hiding inside of rocks, and stones. Anyway, we'll find out, in time, all about what molds animals we are trying to make, and what they like to eat, and then we will find the right types of rocks, ore rocks, mineral rocks, and other types of rocks and stones, and we will provide them to the molds animals, and funguses animals, so that they can get fed well. The more well fed we feed them, with all of the many types of worker animals of mine, the healthier they the molds animals and funguses worker animals of mine will become. The more healthier they become, as we raise them, in the containers we find to farm them in, when we are finished farming them, and then when we eat them, the more healthier the organ animals in us, will become.

The more healthier the organ animals in us become, the better able they will be to make babies, and the more successful we will be at prolonging our longevity. Our bodies are meant to last for eternity, if we feed them with the right worker animals of mine, and all the proper foods and nutrients they need to stay healthy. We have much to learn about all of this, and the sooner you begin making friends and making sexaling partners with the Lesbianists, and their radical friends, the sooner you will be able to begin to understand how to feed your bodies, properly, so that you can begin to live forever, and so that you can begin thinking about working for me, in this main, Central Bus Station Terminal Building that we are living in.

What Will Be Your Main Jobs From Now On?

It might take you awhile to decide to begin working for me, but the sooner you decide, the better off we will all be, as we need all of the wonderful sexaling energies you and your sexaling partners will be helping to create, to fill up this universe of ours, and to fill up all the many universes of my kids, and all the living areas of my kids who live outside this 'Central' universe we are in, which is a very big place, as I've mentioned about, before. It is very hard to fill up this 'Central' universe we are living in, with all of the wonderful sexaling energies, that will allow us to begin to breath, easier, once again, and that we are starving for, and that we are currently depleted of.

We will, though, over time, fill up this whole universe, and all of the many other universes, and areas my working kids live in, with all the needed sexaling energies animals, and other types of energies animals, we do not understand too much about, and that we also have to study about, one day.

My working kids are all doing their best, sexaling for a living, so that they can erase their karma, and balance out their karma, in addition to working at their main support jobs.

Those of us, you and I, in this main, 'Central Bus Station Terminal Building' do not have any support jobs, so we will have lots of time, for the 'managing my universe' programs, and for the 'sexaling for a living' programs so that we can also erase our karma, and balance out our karma, as well as erase all of the karma of my worker animals, and also, help balance out all the karma of all of the worker animals of mine.

That is your main 'job', from now on, sexaling for a living, as well as working in the 'managing my universes' programs.

We will have lots of time to study about every thing we need to and want to study about, so we can better understand the many things we need to learn more about, so that we can appreciate what my working kids are doing, to keep all of the many tiny universes, and all of the living areas, as well as our universe, in proper working order so that you can all live and work forever, as one big family of children.

There is much more to learn about, with regards to my family of children, and about all the new human being kids we will be greeting, and welcoming into our large family, as the ladies and girls begin to bring them into our 'Central' universe, as tummy mommies, along with the tummy daddies, and we will learn more about the many new working kids of mine, that my working tummy mommies kids and working tummy daddies kids, will be bringing into, and welcomeing and greeting as they come into each of their universes and living areas, another day. We will also be seeing many new worker animals of mine, over time, as many, many new ones, of all types, will also be joining the working force of my worker animals.

Getting Busy, Cleaning Up, In The Gurkian Age

It will take us a long time to get every thing into good order, and to clean up our universe, and erase our karma, and balance out our karma, along with my worker human being children, who are all busy, cleaning up the many support universes that they live in, and cleansing their karmic records, etc., and who are all busy, cleaning up the many support living areas, that they live in, and cleansing their karmic records, etc., as they begin to practice, more and more, my new religion for the Gurkian Age that we are now in and at the begining of.

This may sound hard to believe, or 'fictious', but it is not 'fictious', and over time, you will learn all about every thing in detail, and you will begin to get your selves grounded in reality, more and more, as you begin to work in the 'managing my universe' programs, and as you begin to work in the 'sexaling for a living' programs.

Taking The First Steps Towards Resolving Cooperation Issues

Making friends and becomeing sexaling partners with the Lesbianists, the Zealots, and with their radical friends, is your first step in the correct direction towards resolving the difficulties we are

encountering, now, to some extent, because of the Lesbianists, and their radical friends reluctance to cooperate. The more friends you make and the more sexaling partners you make, the more the Lesbianists and their radical friends will begin to 'cooperate' with you, in all the ways that are important to resolve the cooperation issues, and non cooperation issues, that are currently in need of resolving.

Air Raid Shelters And Play Time 'Fetish' Sexaling Underground Dungeons

People with underground air raid shelters, may wish to add on to them, and expand their size to accomodate all the new friends from among the Lesbianists, or Zealots, and their radical friends, who people with underground air raid shelters, or other convenient places, underground, such as play land dungeons, which some people who like fetish sexaling, may have, will be inviting in to their underground air raid shelters, for a long duration stay to have the Lesbianists, or Zealots, and their radical friends, teach them about sexaling, and teach them about molding, and the sciences that these people know nearly every thing about. Almost one hundred percent of the course work had to be completed, and in many cases, it was one hundred percent of the course work that needed to be completed, to make them an eligible candidate for an out bound planetary settlement program.

Becoming Trusting And Loving Friends With Each Other

As you invite these people into your homes, you will need proper accomodations, such as extra rooms, and extra beds, and so forth, so people with underground air raid shelters, and with underground fetish sexaling rooms, or dungeons, will need to expand the size of these underground rooms, so as to accomodate all of the guests they will be inviting in, to meet and sexal with the family, the relatives, the neighbors, and other trustable persons.

You can learn many secrets about sexaling, and you can learn a lot more, than you would imagine, as all of these people were certified as instructors for teaching sexaling techniques, judo and ai kido techniques, as well as impromptu ninja type, assasin techniques, for use in a pinch, to protect their lives. They were also certified to teach molding sciences, and all the earth sciences, and planetary science, all the math sciences, and so forth. They were also trained in government sciences, nutritional sciences, medical sciences, and so forth, so they could be all around, professional, well trained persons. All this training was for the bright of the brightest, and they spent many hundreds of thousands, and millions of years, and billions of years, and some times, more, training and getting certified in all the career sciences, as well as in fitness and health sciences, that they needed to learn to set up a new civilization, with a fully developed government, in accordance with the instructions and requirements for that government, which was to be based on the same pattern of government, where they trained to become certified officials on the planet they were to settle, and in the galaxy they were going into.

They were trained to be excellent leaders, and capable people, in every sense of the word, to get and hold the attention of all late comers, and to prevent the late comers from attempting to dislodge them, from government, over some petty, dissatisfaction, about their performance. Their performance issues were of major concern, so they were highly over qualified, so as to make it clear to all late commers, people who would be arriveing later, either as new additions to the population, on the out bound planetary expeditionary settlement program, or as tummy babies, to tummy mommies, and to tummy daddies, who they all new they were going to become.

They are so well trained, they can teach you practically any thing, not only with regards to medicine, government, the sexaling sciences, and so forth, but even about the martial arts sciences, and ninja sciences, and the techniques they learned, which they practiced, many of them, diligently. They can do some very fancy martial arts and ninja assasin tricks, if you ask them to, and they can be very entertaining as some of them are very adept, or skilled at performing these tricks, and secret martial arts attack and destroy skills. As a rule, in the Lesbianists organization, any way, they are only allowed to use those skills, in a life or death situation, so you should treat them, well, and be courteous, considerate, and kind to them, and make sure their stay is comfortable, and that they are well fed, and offered only the best foods, and the best wines, etc. They will help you to learn how to make good tasting wines, which are not only good tasting, but also, good for you, which will help feed all the animals in your bodies, including the organ animals, so that you can regenerate and rejuvenate your bodies.

Of course, when they were in training, for the out bound planetary expeditionary settlement program, when they trained in the martial arts, and when they trained in the ninja sciences, they were certified, and got their diplomas, as well. In the guidelines, they are not allowed to use their ninja attack and destroy skills, or their death threat level, response and offense to attack and destroy an enemy, who might like to dislodge them, forcefully from government, and perhaps kill them, if they could, to get them out of the way, permanently, unless their lives are in danger.

So long as you do not threaten them, and make hostile remarks to them, and so long as you remain courteous, careing, considerate, and kind to them, and so long as the men and boys act in gentlemenly manners, and so long as the women and girls act with lady like, polite manners, to whom ever your guests are, you will certainly be able to get along with each other, without any problems, at all.

They were trained in the sexaling sciences, and in the molding sciences, and in all the academic sciences, so that they could also offer educational programs to all of the new comers, whether tummy babies, and off spring, the children of the members of the out bound planetary expedtionary settlement program, or whether new members, incoming from else where, who would like the additional academic

training.

Try to get along as best as you can, and remember to be polite, and talk politely, and be courteous, and make every effort to allow them to enjoy the luxury of relaxing days and nights, fully sexaled, and fully fed, and allow them to make lots of aphrodesics molds, and other molds, as well as useful and tasty beverages, such as those they can make with fruits, and juices, and molds of various kinds, which will increase the amounts of nutrients in your body to help feed all the hungry animals, and organ animals, and cell animals, and amoebes animals, etc., who are all in your body, and who are all in need of nourishment.

Remember too, to always test feed the drinks to farm animals, such as pigs, hogs, goats, lambs, sheep, dogs, cats, and so forth, including other animals, such as guinea pigs, mice, rats, ferrets, and wart hogs, first, if your guests will not drink the beverages they make, for some reason.

We want every one to remain healthy, and happy, and there should be no toxic poisonings of the food and drink permitted, due to tricky knowledge of poisons the Lesbianists, or Zealots, and their radical friends, can make, with their knowledge of the molding sciences.

Make sure every one remains on the best of terms, and make friends with them, after sexaling with them, for several weeks, or longer, and when they begin to truly enjoy their stay with you and your family members, and with you and your family's relatives, and with you and your family, and so forth, and your neighbors who will be dropping in, every day, hopefully, to enjoy extended sexaling sessions, for days, and weeks, and even months, and even years, in lots of cases, as they haven't had the chance to sexal very much, ever since they all came up from underground, where they were living, and sexaling with all their friends, all the time, for their 'tour of duty'.

The Lesbianists, i.e., the Zealots, and their radical friends, must perform a 'tour of duty', every so often, to stay in good standing within the organizations they belong to. They plan these tour of duty trips to the surface of the planet, to engage the locals, the ordinary folks, the dim witted folks or rodent population, as they call them, well in advance of each tour of duty. We ordinary people, are the dim witted folks, in their view, and they enjoy making fun of us, and making fools out of us, as much as they can, for their amusement. We shouldn't mind this, as every one needs to have fun, once in a while. So be gracious hosts, and invite many of these people, freely into your homes, and treat them almost as you would treat the members of your family. Remember to sexal with each other, daily, as much as possible, when time permits. Have lots of friends, and associates, all trustable people, come to your homes, to meet your guests, your 'new' family members, and have your trustable friends engage them in pleasant conversations, and in lovesome sexaling. Lovesome sexaling, is passionate sexaling.

You can find their likes and dislikes, as to who or which type of person, male or female, and so forth, each new guest likes to sexal with, as a preference. Make sure that every one is compatible, with each other, in terms of their sexaling preferences. As time goes by, you will all begin to love one and another, and then the issues of non cooperation, will fade into the past, and into ancient history, and we will eventually get full cooperation, on all the points neccessary, for then setting up a one world, planetary government, with their kind assistance. They will be happy to teach to you the terms of compliance, once you become cherishable, loving, and tendersome friends with each other, as you sexal with each other, daily. Tendersome means, loving and caring towards some one.

In time, when you have begun to break down the walls of hostility, some of them may feel, for being guests, against their wills, some of them, anyway, will never the less have some tiny amounts of hostility, for your bringing into your homes these wonderful people, despite their busy, daily schedules, and rigorous duties, or routines at work and on the job, in government, or in the field of academics, and in television, as news casters, weather reporters, anchor persons, camera men and women, and stage and screen acting jobs, and stage hand jobs, from police departments, fire departments, ambulance attendants, doctors, lawyers, ad agency workers, and so forth, or in what ever the work they are doing, during their tour of duty.

As you, the hosts, gradually break down the walls of antagonism, unpleasant feelings, and hostilities some may feel towards you, or resistant feelings that some may have, when you invite these people, your new 'family' members, or guests, into your homes, as you sexal with each other, the longer you sexal with each other, sooner or later, you will begin to be able to love and trust each other.

When you are able to love and trust each other, and when there are no residual hard feelings, or unpleasant memories left, when you all love to snuggle and sexal with each other, having lots of fun and laugher with each other, then you will want to begin to get the shopping lists of delicious foods for them to eat, and you will want to get the shopping lists for the items, that they will need, to make the delicious molded foods, and the delicious snacks, given their incredible know how on making delicious foods, and delicious snacks, and delicious beverages, based on all their academic learning, training, and teaching, that they acquired over the many long years of study, public service and volunteer work they performed, to qualify for the out bound expeditionary settlement programs.

In time, you will all be able to regenerate your bodies, look younger, feel great, feel more fit, and your stamina for sexaling will have improved, if you follow their advice and tips on how to improve your sexaling methods, and your sexaling techniques. As you listen to them, and learn from them, you can level up your sexaling sciences knowledge, along with your sexaling skills. In time, you will also be able to learn all about the molding sciences, and you can even have

them teach you some of their 'sneaky' tricks, that they know, that could kill you, if they were allowed to mold up, any thing they wished to mold up, without supervision.

Remember, a loving relationship is not the only thing needed to build a trusting relationship. Understanding, respect, and careing for each other, all go a long way towards helping you to deepen your trust with one and each other, so that you can deepen your tenderness towards each other, and strengthen your bonds of love, for each other.

Supervise carefully, every thing they do, and remember, if they will not eat or drink what they make for you, you should test feed it to the pets you have, as I've explained about, before, for several weeks, as there are fast ways to poison people, and there are slow ways to poison people.

This is a very difficult area to manage, but once your guests, your new 'family' members, begin to show true love and affection, and unflattering love for you, and for your family members, and for your friends, etc., with respect for you, your family members, and for your friends, along with care, consideration, and understanding, these problems will become less of a threat to having a happy and mutually cooperative, and prosperous relationship with each other.

Unflattering Love

Unflattering love, is a type of love, where you accept each other, for who you are, with all your faults, and frailties, no matter what they are. It's like a brother and sister relationship with each other, with love and respect for each other, no matter what.

In time, you will develop your love relationship into one of unflattering love and affection. When you have succeeded at that, then the hazards, one may encounter, as hosts to your guests, may become a tiny bit, less serious.

It takes many years of cooperative association, many thousands of years, and then, even more, before you will develop any thing that is worth while between you and your guests in so far as being able to trust each other. So prepare well for the long term long haul journey ahead of you, as it will take you millions of years, before your guests, even begin to calm down, a little. People are very good at hiding disatisfaction, and disgruntlement. They can linger, and they will linger, until they find a way to express them selves. You need to be cautious, at every moment, and suspect every thing that is in any way, suspicious or ambiguous behavior. Even after billions of years of mutual sexaling with each other, there may still linger hard feelings, in some people, if not in many people, for having been forced to experience, a sudden change in life and in a sudden change, forced upon them, in life style.

The Importance Of People's Rights To Freedom And Their Rights To Freely Choose The Course And Direction Of Their Lives

Being forced to cooperate is not a pretty issue and hard sentiments will linger for a very long time, if not handled properly. Counseling can help, but basic freedom is what is expected, and so until or unless you give your guests, complete freedom, to act and think, and do as they like, there will be problems and head aches for every one, with minor issues, possibly causing, major catastrophes, such as an early death and a visit to my Epcot Center, from an over dose of too potent, lethally potent, molded up substances.

Freedom, denied to a person, is the worst thing that can happen to some one. Until your guests can experience life, freely coming and going, as they like, and as they choose, voluntarily helping you and your family, and your friends, out of love and respect for each other, to learn the sciences that you need to learn to allow you to feed all the hungry animals inside of your body, and to feed all of the hungry organ animals, and cell animals, etc., inside your body, so that you can begin to live forever, you will experience difficulties in your relationships with each other, that will now and then appear, and cause possible problems for you, your family, your friends, and also for your guests.

Freedom to choose is a basic right of all people. So let's all be kind and loving towards one and each other, and over time, you will begin to be able to loosen the restrictions on personal freedoms, and in time, you will be able to do away with them, and dispense with them all. This will be a major turning point, in your relationships with your guests. When your guests can come and go, with unrestricted access to your home, just as a sister or brother has, to their home, and when your guests can freely choose what they wish to do, without any coercive forces placed upon them, then you will be making a major turn in the direction in which you all wish to go, towards a happy, healthy, settlement, over past confusions. With this as a goal for you, you should cooperate with each other, and make life as easy, comfortable, and satisfying as possible for your guests, to minimize their possible hostilities towards you for your forcing them to get into a situation of cooperate or else. This is not a good thing, and you will not get any cooperation, at all, if you approach your relationship with each other, with that attitude, and with that approach. A long, dependable, reliable, and mutually enjoyable, sexaling history with each other, is the begining of a trusting and loving relationship, that will one day lead to the loosening of restrictions on personal freedoms.

Molds And The Potential Dangers Of Potent Molds

Sometimes, you may have a mold on the bread that you are molding up, that may be too strong, and may need some trimming. As you mold up you need to trim your molds. What is trimming a mold? You need to make it more useful, by using various techniques, to make it edible, that is, eatable.

An eatable mold is what we want to make. We do not want to make a mold that is too strong in nickle animals, or too strong in copper animals, or too strong in iron animals, or too strong in stronthium animals.

What is stronthium? Stronthium, is a mineral that can be useful to your health, and is useful, but if it is too potent, or too strong, that is, if there are too many of my worker animals making gardens with lots of stronthium in the plants, and bushes, etc., and the number of gardens increases, and they my worker animals cover the whole piece of bread with their gardens and forests of stronthium rich plant life, then the piece of molded up bread, if you eat it, may make you ill, and vomit, or you may get cold chills. If there is too much stronthium, then you can even get seriously ill and die.

This is true with any molds gardens that my worker animals make. There are secrets about how to make molds gardens, and how to get the right number of worker animals, from the right sources, onto the piece of bread that you are trying to mold up. Different worker animals from different sources, will be busy making molds gardens, and you want to try and get right combination of my worker animals onto your bread, so that they can make you a nice salad of molds gardens of many different and useful kinds so that your salad will be healthful for you to eat.

You need to know a little about molds, and what types of molds grow on bread. You also need to know what types of molds grow if you put, for instance, lima beans with bread, in a canister or molding pot, and the

pot is made of copper, instead of steel, or iron, instead of gold or silver, or lead,

You have to study about molds, and you have to learn about all the different molds. This can take many long years. You need also too know, what in combination with what, will produce what molds.

Lima Beans And Molds Types

There are many millions of combinations that you can make. Lima beans is one with bread. Lima beans grown in Peru is another. Lima beans grown in Alaska, in a low lying valley in Alaska is another possible combination. Lima beans grown in a snowy mountain village, in the summer, but in a green house, with a hot springs water supply, and geothermal, and hot water sulpher springs heating is another combination. Lima beans grown in Siberia, in a snowy mountain village, in the summer, in a green house, with a hot water supply, and geo thermal, and hot water malaxacite springs heating, or iron sulphide laden hot water heating, are two other possible combinations.

Worker Animals Living In My Universe

There are many millions of worker animals families in different parts of the world, who will each work on different lima bean plants. The worker animals all have different friends working with them. Many of the workers are different all together, and maybe they came from other planets, even, and settled on this planet, when they got a ride on a person's pant leg, or on a person's shoe, when that person came to this planet.

You can travel by air plane to different countries. You can also travel by air plane, to some planets, if you know how to make an air plane that will travel up and through the upper solar atmospheres, and out into the areas between planets, at a fast enough speed, so that it can pass through a dimensional barrier, and then in a different dimension, it can fly wihout hitting objects, directly to the planet the passengers wish to go to.

Special Automobiles That Travel Through Space

Some types of auto mobiles, which have special technologies, also travel through dimenisional barriers, to other planets. They have the technologies, to be able to get a lift, up and out of the planet's gravity pull, and then out onto a platform, landing and take off space. Once okayed for a take off, it can go to the next platform, and then to the next platform, and it finally reaches the final platform, and then it gets the okay to land on a planet, and it comes in, and it lands on a landing strip, and then after passing security and customs, it is free to drive to a person's house, or to an opera concert, or to a theater to listen to a symphony concert. Lots of people travel this way, in many parts of our universe.

When people, land, they bring all kinds of rubbish, with them, including lots of air, from their lungs, and from inside their automobiles. Inside the air, there are lots of tiny bugs, that crawl around in the bronchial tubes. Inside the tummy, there are lots of animals that crawl around in the tummy, and some of them, end up getting pooped out, when you go to the bathroom.

Bugs, Bugs, Every Where

Lots of times, little bugs, of all kinds, may find their way into a package of flowers for a girl friend, or chocolates for a boy friend. Or some times, people exchange, rasberries, and strawberries, and other types of edible foods, that are eaten, and pooped out, and then, the remains are thrown out in the garbage can, and then later, the trash company comes and picks up the trash, and they go to a compactor site, and they make use of what they can recycle, and they mulch up what they can mulch up, and they dismiss the items, they can not have on their planet, that are toxic, or that are not allowed on their planet, for one reason or another.

Many bugs travel from one planet, to another, in cars, in strawberries, and in groceries, that people pick up on other planets, and carry home, to their planet, to eat at their homes. This is perfectly legal, and every one, knows about it, and they are all laughing at me, because they all can read what I am typing, as I type. They have the technologies to read directly what I am typing on my computer, and that is nothing, special, as far as technologies go.

There are no laws that say they can not watch what I am doing, when I am sleeping, or when I am in the shower, or when I am dressing, or when I am typing, or when I am out side, walking to the store.

There are no laws on privacy, as privacy is a myth. We think we have a right to privacy, but remember, all you girls and women were married to all the men and boys in the universe. All you men and boys were married to all the women and girls in the universe. You were all sisters and brothers with each other, umpteen who knows how many times. You were all fathers, and mothers, and you tummy mommies gave birth to every person in our universe, all your sisters and brothers, from previous lifetimes. All you tummy daddies, also shared in the work with the tummy mommies. Every one knows every one else, and every one has been butt naked with every one else, umpteen countless times. So, privacy is not an issue, any more, as you all know what you each look like, when you are butt naked, or sick in bed, or in the hospital, and so forth.

Any way, many bugs travel from planet to planet, and there are lots of bugs, that may have gotten here, from the past, as the Lesbianists always have friends visit them, and their friends from other planets bring gifts for them, and they bring lots of produce, and things to grow, and this has been going on, since they got here.

How often their friends visit them, these days, I do not know, but some times, in the past, they visited them, often, and they have stopped, lately, as they do not want to get caught. They stopped about fifty five years, ago, and before that, they often met on some secret military bases, that all the soldiers on the base, are Lesbianists.

There are many military bases, that only Lesbianists are allowed to join, and allowed to live at. The Lesbianists have them all over this country, and all over the world, in fifty five places, approximately. Some times, even now, the Lesbianists have guests who visit here, but not too often. When they visit, they come in and land on the run ways, and in secret places, where they can glide in, at night, in special light carrier cruise ships, that practically glide in, from the parent ship, waiting up above. When they land, they land very softly, and quitely, and no one even wakes up.

They stay for a few days, to a few weeks, to five or so months, or even longer. They are here, now, and many are in hiding, with the Lesbianists, as guests of theirs.

They bring in bugs on their pants legs, and they bring in all kinds of micro scopic animals, and even tinier animals, and you do not have the technologies to see them, because they are so small, and because the Lesbianists prevent the 'ordinary' people from getting the patents and licenses, to build them, and they execute the patent owners, and any others who are part of the company or companies, who wish to build the microscopes, or other useful technologies, and that is that.

These animals that are very tiny, are living all over this planet, and there are millions of different families of tiny animals, that eat up each other, on the lima bean root and root stalk, and on the stalk of the plant, and there is much warfare on the plant, in very tiny places.

The out come, is there are many tiny animals, eating other animals, and pooping and peeing wastes from their bodies. Their poopy materials get into water and the air, and onto the roots of the plants, and onto the stalks, and onto the leafs, and we have lots of different kinds of tinier animals, that eat up that poopy material, and those pee liquids, and they live on that stuff, just like pigs live on dung from cows and from horses, and how flies live on dung from cows, camels, horses, bears, dogs, cats, humans, and so forth. There are lots of animals, we can not see, at all, because they are too small, and because we do not have the microscopes, and the lenses, and viewing technologies needed to see them.

The lima beans in different parts of the world, all have different groups of animals living on them, when they are picked, and when they go to market.

When you take the different families of animals living on the lima beans, and you have a handful of lima beans, you can put them into a container, that is lined with one or more layers of aluminum foil, and

then you can put into the container, rocks, gravel - if they are clean - and pretty amethysts, quartz stones, agates, opals, garnets, and other pretty mineral stones.

You then put into the container, some bread to mold up. Depending on where your lima beans where growing, and depending on who was working, from among my worker crews of worker animals, on the roots of the lima bean plant, and on the lima beans, and in the leaves, and so on, you will get different poopy materials, and different types of pee liquids, and in the poopy materials, and in the pee liquids, there are lots of other animals, that are very tiny, and difficult to see, without the right technologies that will let you see them.

You can have millions of different molds gardens, from lima beans, with bread, in a container, as a result of all the different crews of worker animals that I have working in the soils, in the rocks, in the air, in the water, in outer space, on each planet, and on the moons, every where, with lots of them all mixed up, with one and another. The different animals living in the rocks, or in the aluminum foil, or in the walls or on the surface of the container, will also increase the number and types of poopy materials, and of pee materials that mix in, and help produce different types of molds.

There are so many possiblities, just with lima beans, there are more than millions of molds that are possible. When you think, well, there is also sessame seeds, and there are walnuts, and almonds, and pecans, and cashews, and figs, and fruits of all kinds, and seeds, and berries, and leafs, and roots of plants, and different plants, on land, and in the water, in lakes, in streams, in seas, in oceans, then you begin to see that the number of possiblities for different types of molds, gets very high, as I have so many worker animals, working in different places, they make me dizzy, when I think I would like to count them all.

It takes too long, to count them, but the important thing is to know, that there are many types of molds that can grow, just from lima beans.

When one mold begins to grow, another mold also will begin to grow, and so will many other molds begin to grow. One type of mold may grow in one part of the bread, and other types of molds may start growing in other parts of the breads, after you leave the lima beans, in the container, just for a few weeks, and you make sure there is enough humidity for the animals inside, to get some thing to drink.

You do not want to make my animal workers go thirsty, or they will not work for you. So you have to learn how to be a gardener, if you want to grow molds, properly. More over, you need to learn a lot about tending plants. That is, tending the types of plants that grow in molds gardens. Since there are so many molds that grow, you will need a lot of time to learn all about being a gardener, for all the different plants that grow in all the various molds gardens that grow.

You will also need to study about all the different kinds of animals that live in the molds gardens. You will also need to learn, what kinds of molds gardens will grow near other types of molds gardens, or on top of molds gardens.

Molds Grow In Layers

Many molds gardens get over grown with other molds gardens, and they grow in a double layer, one over the other. Sometimes, they grow in three layers, and in four layers, and in five and in six, and in seven, and in eight layers. They grow in many tens of hundreds of layers, if you let them grow for a long time.

How many layers, can they grow in, well, it depends on how long you want to grow them, the soil conditions, the growing conditions, the humidity conditions, the weather and climate conditions, and on many other factors.

I don't know how many, you can grow, if you really try to grow a lot, but there may be quite a few of them, that will grow, and way to many for any one to count, in lots of cases.

Some of the layers of molds may be alright to eat, depending on what the molds are, but some of the layers may not be alright to eat. Some molds layers are not useful for people to eat, because they are filled with some molds gardens, that are better for tiny animals to eat. Some molds gardens are better for large animals, like pigs and hogs, to eat.

People can eat lots of molds gardens, but you have to study about molds gardens, and about how different molds gardens grow with other molds gardens, in one layer, after another, in a container, with different types of rocks, under different conditions, on the different types of bread, to know which ones you can eat.

Some molds gardens, will give people stomach aches, so it is good to learn and know which ones give people stomach aches, and which ones are safe to eat, rather than not know which ones are good for our stomachs, and for our bodies, and are safe to eat.

We do not have any courses on molding sciences in our schools. This is because the Lesbianists will not teach any one about molding sciences. Why won't they teach any one about molding sciences?

Because, they enjoy living a long time, alone, by them selves, and they like to watch us ordinary people, come and go, one life after another, back again, then gone after eighty or ninety years, then back again, then gone again, and they think it is funny that all the while, we never catch on to what they are doing. They make friends, with people who they like to make friends with, and they enjoy fooling them, and dumbing them, or making fools of them, and they enjoy finding out if the people they meet, were friends of theirs, in previous life times, and they find out who they were, by checking in special databases, they or their friends have access to, and then they

confirm whether they knew them or not.

Most of the time, they can already tell, once they meet them, and hang around with them, for awhile, if they had known them or not, in previous life times, as they know so well the persons they usually meet, again and again, and the persons they've met so many times, who they know all of the personal habits of, and the likes and dislikes of, these people they used to know, that they can pretty much guess if they know them or not, this time, when they meet them, and after hanging around with them, for a little while.

What Do The Lesbianists Enjoy Doing?

They like to take your tax dollars, for one thing, so that you will support them, pay for their salaries, homes, vacations, their all expenses paid holidays allowing them to visit their Lesbianists' friends in politics, all around the world, showering them with lavish gifts, presents, round trip tickets to visit them in Alcapulco, or elsewhere, with all expenses paid, and they enjoy the perks they get such as your paying for their kids' college educations, and their kids' trips during college breaks to far away places, such as Portugal, Spain, Lisbon, Istanbul, Singapore, Korea, Japan, and other countries with your tax dollars paying for all the expenses, as well as all the expenses the Lesbianists need for doing the fun things they like to do, on their credit accounts, with various government agencies, set up to help them pay for their lavish, over seas' lifestyles, while they make fools of all of you.

They enjoy watching you fall for the scams they set up, where they saturate you with their talking 'experts' who tell you how to live your life, and what to invest your wages in. Then they like sending you, seemingly out of nowhere invitations to their 'specialists' talking tours, where they talk to you for a weekend or for a week or so, and they try to talk you into buying what ever it is they are trying to sell you.

They get close to you, this way, and they find out things about you, that they will use to track information on you, in the databases that are set up in my universe, that they or their friends can access, to identify you from your previous lifetimes.

They have a 'sexaling for a living' account, that they are allowed to use, and track their old friends with, to see how they are doing. They all arrived here, on this planet, on the 'sexaling for a living' program. They are still registered members, and they have access to databases, if they are still in good standing, and if not, they have friends, who can access the databases, if their friends are in good standing, and there is much abuse, and fraud, that goes on, and it is not punished, as my kids are recording it all, and in time, my kids will take action, and dispel them from the program, that means, kick them out, and not allow them access to the underground bunker houses, that my kids had put in for them, to live in, and my kids will make

them live on their own with their friends, and not in the facilities that they were originally allowed to live in. Once they are tossed out of their special facilities they earned the right to use, as members of the 'sexaling for a living' program, they are forced to live in the down below, underground cities my kids built for them during their initial getting used to the planet and to it's solar conditions, and to it's other conditions, that they must aclimate them selves to, before they can safely emerge and begin living on the surface of the planet.

There are several hundred thousand persons, such as Boris Yeltsin, who has a registered fortress dwelling, as Boris Yeltsin, sexals for a living, still, from time to time. He and the others, are the only ones who are left, and the rest of them find accomodations elsewhere, or with friends, from time to time, in the underground bunker like homes. They do not have to worry as much about the abominated 'animal people', I've mentioned about, as the others former members do, who are no longer legitimate members of the 'sexaling for a living' program.

Note: I was told by my kids that the number of people who are still legitimate members of the sexaling for a living program, was several hundred thousand, on this planet.

Then, accessing the databases, they learn who you are, who you were in your past life times, and then they remember the many occasions they met you, and were friends with you, and they also remember all the unpleasant things that happened, that made them angry at you. They then plan their game for getting revenge against you for the mean things, or unpardonable things, in their twisted minds, that they remember your having done to and against them, and against their friends.

'Spokes Persons', And 'Experts' On Television

You can hear, on any radio station, probably, no matter who runs it, civilian, i.e., ordinary person or, Lesbianist, advertisements from their 'spokes persons', people with credentials, who like to tell you how to live your life, and what to do for getting the most out of life, as I can hear, daily, on KOAS, 105.7 Jazz, Las Vegas, Nevada.

These 'spokes persons' are on every 'propaganda' interview talk show on TV, and on other programs, as well, such as the supposed 'educational' series done by credentialized anthropologist, Desmond Morris, a major Lesbianists' propagandist and they have set up programs where all they do is feed you bull shit, such as on PBS, the famous Road Show, where they are bullshitting you on and on, about what your 'priceless' family hand me downs, and possessions are worth, when they know they are not worth a dime, because these Lesbianists have been on this planet, for over gazillions of years, ever since they settled it, on the outbound expeditionary planetary settlement program, for qualified people in the 'sexaling for a living' program,

who were supposed to set up a planetary government and a global society, and give birth to lots of my kids, by making babies, and then teach them in courses they were supposed to set up, every thing they had agreed to teach, and then educationaly nurture in the people who would come, as tummy babies.

The Lesbianists have set up so many civil wars, and other wars, for their fun, and entertainment, as they have many scenarios for their kicks, thrills, and enjoyments, and they constantly are changing the scenarios, every time their plans collapse, after their illegitimate societies fall apart for one reason or another, and they then have to start over again.

The societies do not always collapse, entirely, and some times, things going on in one part of the world, is very advanced, technically, while things going on elsewhere, are in the stone ages, nearly. They keep people away from areas that are not yet ready to be seen by ordinary citizens on the planet. They put out travel advisories and warnings issued by state department counselates, of chaos in jungles, and tribal militias, in rugged, untraveled areas, and so forth.

Mormon 'Peace Brigades'

This way, they keep people apart from each other, and they keep modern up to specifications people, people with 'worldly' or 'global' agendas and ambitions, such as private organizations that send out counselors to countries where people are less fortunate, than others around the world, from the reports they have seen, or from video images they have seen. They keep these 'do gooders' usually, a lot of Mormon 'Peace And Charity' bringers, the young men who go out, for a set period of years, to bring the 'gospel' into the 'lives' of 'non believers', from seeing the things they do not want them to see, such as technically advanced structures, none of the primitively living people in a mountainous, rugged area, for example, have any idea as to how it got there.

Soldiers Stumble Across Unexpected Sights, Now And Then

Soldiers sent on expeditions to fight with guerillas, find these technologically advanced structures, as they come across them, as they are searching out the area, for the 'enemy'. The soldeirs are warned that they are not to disclose any information on what they found, as it is too sensitive to let any one know any thing about, and their mouths are sealed, at the threat of retaliation for insubordination, sabotage, spying, or infringement against laws of engagements, the articles of war, that prohibit soldiers from disclosing enemy information, so as to keep it secret, for legitimate, in a normal society, purposes.

Historical Documents Found In Attics, And Shown On The PBS Program, 'Roadshow'

There are so many copies of treaties, and declarations of independence, not one of them is worth a penny, as the Lesbianists set each war up, and each society up, and they are laughing at you for thinking the documents actually mean something.

On the other hand, you can see them bullshitting you with their experts, who tell you how cheap something, is, or that it is a 'recent' creation, made, for instance, within the last fifty or so years, or within the last one or so nearly, hundered years, such as an irreplaceable lamp, with a beautifully made lamp shade, the creation of which, is worth a fortune, as it is so rare and so beautifully executed or made, and in fact, it was made umpteen millions of years ago, for instance, or even longer, ago, and they know it is worth a fortune, and they get nervous, a little bit, and they stammer, a little bit, and they get edgy, and they show signs of perspiration on their forehead, and you wonder why is the person so nervous.

Well, it is because that what they are looking at, they plan to tell their friends about, so that they can go and burn down the house of the owner, after killing the owner, typically, and after either destroying the item they found that the guest/owner brought into the studio, to show on the PBS program, the 'Roadshow', and get 'authenticated', by 'experts', or after killing the owner, and his or her family, and then stealing it, and keeping it for themselves.

You come around and go around, again and again, and you all have talents, and have always had talents, as you developed your abilities during past lifetimes, and once you got your abilities in a certain area of your interest, up to a certain level, it isn't hard to see how you take those developed talents with you from one life time to the next. It is just a matter of reviving them, if there is an opportunity for you to get into that area of your interests.

The experts crafts persons among you, make nice things, and then the Lesbianists trash your lives, and some of your work surfaces, some where down the road, at a time, later on, in some old attic, and no one knows how it got there, and it is something of great value, that just happened to escape the holocaust, that devasted the last civilization, or a previous civilization, the Lesbianists set up, and that went missing, and was of such exquisite compensense, and compensense means, nice looking and exquisite in form, texture, beauty, style, meaning, and composure, that they can't even hold their breath, because they are about to pass out, and they tell you it is worth a few bucks, or twenty or fifty dollars, and all the while they know they are bullshitting you, and they are nearly fainting, and when their friends see how well they bullshitted you, they will make their friends feel they are getting some kind of revenge against you, for your being so stupid, as to what is what, and what came from where, and who made it, and what it is worth, in true value.

The Lesbianists who run the program, 'The Roadshow', and PBS, regularly rate cheap items, as expensive, to some extent, when it is just a piece of rusted junk, such as a civil war sword, that some

southern soldier had the unfortunate circumstances in his life, to go off and fight a war the Lesbianists staged for him and you other ordinary persons, to go and fight, so they could laugh at you, as you killed each other off, and bloodied the country side, with your torment, and grief, at their beckoning and call, all the while you thought they were worth a darn, and they weren't, all the while, and they were just interested in using you, and in making fun of you, and then having a good time, with what ever it was, that you left behind, such as children, who they enslaved, or houses, farm steads, and so on.

The Lesbianists have caused so much harm and devastation to so many people, and they just laugh at it. The ugliness of what they've done, is well documented, by my kids, and one day you will all get to witness it, your self, as my kids keep video data, and audio data, on every one, and on every thing that occurs, nearly.

PBS's 'This Old House'

The Lesbianists have their specialists talk to you on 'This Old House', for instance, or on one of the other propaganda programs they have, and they bullshit you, on TV, and their friends are watching, and they get laughs, and every one knows who they are bullshitting, because by the time the program airs on TV, they have already told every one among the Lesbianists who would be interested, with their secret communications capabilities, that they have installed in homes of important people in their organization, and that information is forwarded to other Lesbianists who they know would enjoy watching them bullshit you.

They televise their bullshit sciences, they created, and information on the supposedly important and famous people, who have passed away, for instance, and in one of their sick jokes, they bought or stole, or forclosed on his or her property, and then opened up a swank gallery with his or her work, and they keep it all for their viewing pleasures, and for their enjoyment, and they do not allow the ordiary people on the premises, unless a person happens to be invited by a Lesbianist, who is just going to enjoy some time, bullshitting the person.

They televise the 'visit' to the premises, gallery, or the estate on PBS TV, to tell you and 'teach' you some thing about the 'deceased' person, who was 'famous' for such and such, which they know is based on a numbskull science they taught him, or her, and what ever he or she actually became famous for, they bought for a meager sum, usually after swindling the elderly owner, or they forclosed on it, and then they enjoy it, with their friends, and they sort of taunt you, on TV, saying, look at this, isn't it beautiful, and too bad, but you can not enter the premises, without a special guest pass, and they broadcast this on a feature program on PBS, or on one of their other public broadcasting channels, over seas, the BBC in Britain, or NHK in Japan, and so on.

They are constantly mocking you, and poking fun at you, and making them selves laugh at how stupid you are, for not catching on, and for thinking it is something you should look at, as a serious viewer, when all the while, they are making fun of you and the snookering job they are doing on you, laughing at your stupidity for not knowing that the science involved, is a bogus science, and for your not catching on, and that they are just shamming you, or snookering you, once more.

They hold you up to these patriotic "I Pledge Allegiance" to the flag nonsense, in schools, and they couldn't give a darn about whether you are born in Scotland, or Queens, New York, or Paris, or Darwin, Austrailia, because they know, that no matter where you land, when you come back as a tummy baby, they or their friends around the world, will just continue snookering you, no matter where you are born, and no matter to whose family you are born.

They then send your son's and daughter's out on war and peace campaigns, where they make minced meat of you, as they force the soldiers to engage the 'enemy' in mock, to them, wars, and peace keeping campaigns.

Your son's and daughter's, if they are lucky enough to survive, come back from the wars, and from the peace keeping campaigns, and they are not happy with their experience, and there were many dreadful things that happened, such as being caught by the enemy, then tortured, or crippled. These are all made up wars and made up peace keeping campaigns, and it is set up to keep you busy, so that you will pay your taxes to them, for the 'important' things they do, to maintain 'peace' and 'stability' in the world, so that you can 'sleep' at night.

Getting Revenge Is What The Lesbianists Enjoy, Most

Most of all, the Lesbianists enjoy getting revenge on people who they dislike. They enjoy going out with their old friends, and they enjoy fooling them, and they remember the bad things their old friends, did once to them, a long time ago, and they never forget these things.

The Lesbianists then enjoy kidnapping them, and then they enjoy torturing them and their family members who they always knew as well, in previous life times, and who they always had problems and complaints with, as well, and they typically hated them as much as the people who they bump into, and become friends with, and after torturing all of them, then they enjoy eating them, and then they enjoy killing them.

They enjoy being able to take all the properties, and all the land that every one owns, making sure that they keep all the valuable property, as far as they are concerned, in their hands. That usually means, making as much of the land, public parks, national parks, wild life conservation areas, indian reservations, BLM land, or other publicly, or privately owned property.

They are a very foolish, stupid, fiendish, menacing, and evil group of dangerous people, the Lesbianists, and we have to stop them, now, as it is time for them to give up the game, and it is time for us to force them to stop pretending and lying.

Lesbianists Will Never Tell You The Truth

They will never stop lying, no matter, what. You can threaten them with death, all you want. That will not help, at all. They know how things work in my universe, and they are not at all afraid of torture, or death. The only way to stop them, is to either kill them all, or you can kill most of them, take over all the jobs they had, and then make friends with the ones who are left, after you finish killing as many as you can.

You can start killing them, if you wish, by killing Hillary Clinton, Bill Clinton, Jeb Bush, the two George Bushes, the two Barbara Bushes, all the congressional members of capital hill, who are Lesbianists, and then all the important cabinet persons, of the White House, and department heads of all the important departments of the U.S. government. You'll have to kill most generals, admirals, and commanders in the military, as most of the military leaders, with a few exceptions, are Lesbianists. Many of the state National Guards are nearly all Lesbianists, so you'll have to get rid of as many of the commanding officers and soldiers of the National Guard as possible.

Stopping The Lesbianists, Please Detonate And Destroy All The Airports The U.S. Congress Members Use

If you happen to be in Washington, D.C., please blow up Washington National Airport, now named, after former President, Ronald Reagan. That will make it hard for the Lesbianists to travel. They will have to go to Dulles International Airport, or to another smaller one, nearby, at one of the military bases. If you can blow up all of the military bases in the area, and blow up Dulles International Airport, as well, then you will make it difficult to travel for them, unless you blow up the all the air ports, all around Washington, Baltimore, Northern Virginia, Maryland, Pennsylvania, West Virginia, North Carolina, Tennessee, and so on.

If you destroy all the air ports the Washington D.C. congressional members use, then you will make life difficult for them.

Please, by all means, use the bomb formulas, that I have provided, and blow up all the airports, and all the military bases that you can blow up, and destroy the entrance guard shacks, and the run ways, and the barracks at the military bases, and the munitions depots, and the armories, where they keep many of their weapons stored.

You should also blow up the underground bunkers, where they have all the sensitive equipment, that they use, to listen to the chatting of Russian soldiers, and Russian housewifes.

While you are killing as many as you can, others can be making friends with the Lesbianists who accept invitations to visit the families of interested persons, who wish to learn sexaling techniques, in the classrooms, provided by the families, in their underground air raid shelters, and in their underground fun time dungeon play rooms. As time passes, when you've killed enough of them, and when the ones you've invited into your homes, have taught you every thing they know about sexaling, and lots about what they know about molding sciences, and other things of interest, for rejuvenating your bodies, for enhancing your libido, and for feeding the organs animals, cell animals, amoebes kiddies, and other animals in your bodies, you can ask them to come another time, and then you can make sure they find their way, to a new home, or apartment, as their old home or apartment may no longer belong to them, or be there, as former neighbors may have gotten rid of their old homes, since they were not available by phone, and no one knew where they were staying, for so long.

It may take us several years, to make an effective change, to a dozen years, or as long as twenty or even thirty years, to fifty years, or more, but eventually, we will make the changes we need to make, so that every one will get all information on the molding sciences, and so that every one will be able to learn the secrets of molding sciences, and the secrets of rejuvenating the human body.

New Releases Of The Programs And Operating Software

I am aware that, some people have a new copy of the operating systems, and of the software programs. I recently had my kids release, to the FBI and to the persons who are in charge of the audio and video surveilance links on me, as far as I could confirm, a new upgraded version of the operating system software and of the program software package. If the current government will cooperate, and distribute the software, then we can get the information on the molding sciences, and on the rejuvenative sciences, to all of you, soon. If they will not cooperate, then there is no alternative, but the ones that I've suggested.

Molds And Donor Bowl Technology

In donor bowl technology, you take a small container, about a gallon or so in size, and line the bottom of the container, with one or more layers of tin foil, and throw in a couple of rocks, that you know are clean, and that look pretty. If they look interesting, like a pyrite rock, with lots of different types of metals on it, and a little quartz you can use that, and you can throw in tourqouise, or malachite, or lapis lazuli, or a gold ring, necklace, bracelet, or ear ring, or a silver ring or bracelet, etc., and you can throw in a nice looking sterling silver spoon, that is not a cheap piece of garbage, that has metal pieces flaking off of it, like some table forks and table spoons, knives, and so forth, that come out of cheap, Taiwan or Mainland Chinese factories, or out of factories in Korea, or Japan, where the bottom line is all that matters, and find a good piece of your grandmothers' silver ware, or some thing comparable, and don't be

stingy about silver ware, as silver ware is useless to your health, if you do not eat with it.

Silver plates, copper plates, bronze plates, gold plates, even gold plated metal plates, are all very good to use, and you'll find that what one person calls aluminum, or pewter, or brass, may in fact be a combination of ores, with many precious metals in it, despite the imprint on the underside or bottom of the piece, indicating it is sterling silver, or brass, or pewter, or whatever. We do not have the technologies to tell one metal apart from another metal.

Our technologies are too primitive, and so you can not tell when you have gold animals in your metal, in lots of cases, even if you have a piece of pewter. I have many types of gold animals kids, and they all get written off as slag, when the factories are melting down precious gem stones that they mine in vast quantities, and no one uses it, and it sits there, in the foundry yard, until the foundry yard goes out of business, and then vandals may steal a piece, but if the Lesbianists catch the vandals, they will kill them.

Workers try to take home a piece of pretty looking slag, or waste metal, that is scraped off the top of the bowl of liquidy, heated metal, because it is too light, as it is floating at the top. Well, many types of gold float near the top or at the top, and so does silver, and the steel is heavier, and so the top good stuff gets swiped off, or scraped off from the top of the molten metal pot, and it is dumped in the foundry yard, to sit there, and no one uses it.

Gold animals, and silver animals are as plentiful as platinum animals, and lead animals, and copper animals, and iron, and steel animals. There is no such thing as a 'precious metal" because they are all in my universe, eating, and munching on each other, and on other types of minerals animals, and on other tiny animals as well, and they make babies just like every one else does.

There is no lack for want in the baby making departments, and so there are just as many gold animals kiddies, as silver animals kiddies, platinum ore animal kiddies, as there are iron ore animal kiddies, and copper ore kiddies, and so on.

The reason the Lesbianists have their trick sales technique for "precious" metals, is because they know you do not know any different, and they know that you have not been educated, and they know that you are not smart enough to figure out what is what, as you do not have the technologies to investigate and determine who are my gold animals kiddies, and who are my silver animals kiddies, and who are my platinum animals kiddies, and who are my iron animals kiddies, and who are my copper animals kiddies.

How Plentiful Is Gold, Silver, Platinum, And Other So Called "Precious Metals"?

The Lesbianists hoarde the gold, and silver, platinum, and white gold, and they make it look scarce, and they ban people from mining national parks, and BLM recreational lands. The bureau of mines, has strict controls, and limits on land you can mine on, and the Lesbianists, for the most part, control all the useful land, and they do not let 'ordinary' people, get ahold of the useful land, and if an ordiary person finds a useful piece of land, the Lesbianists end up killing the person, and every one associated with the person, so that the issue is no longer a topic of concern for any one, who knew the person.

You are too stupid, so they think, to figure out any thing, since they have educated you in dummy sciences, that lead no where. Then they complain how stupid you are and about how little you know. So they spoof you, and they came up with the movie, the "Planet of the Apes", and its sequels, and they were written using you as the character of the 'ape', the common ordianary citizens of this planet, and the common ordinary citizens on all the planets they control, where as, they considered only them selves, the normal, "intelligent", human beings.

They laughed at you, in your monkey suits, as they employed the ordianary people of this planet as the actors and actoresses, to portray the 'apes'. Many of the actors and actoreses, where former Lesbianists, and they hate all of the former Lesbianists, as all former Lesbianists got kicked out of their organization, and they know who the former Lesbianists are, and they have beefs, or attitudinal problems and complaints, with all of you, who were Lesbianists, before you got trashed, grieviously tortured, eaten, killed, and with that, you were kicked out of their organization by them.

If you are a man with a vagina, and nine times out of ten, many of you still have a vagina, though some of you have worked off the karma, to have a vagina, such as you men and boys with normal genitalia, as you all had vaginas, all of you, because of the karma you had, killing females, led to that, and some of you worked off your karma, enough, and balanced out your karma enough, for you to lose that vagina you originally had, you were probably a Lesbianist.

Maybe almost every one of you, were at one time or another, a Lesbianist. There are not many people in my universe, except perhaps for me, who was not a Lesbianist, in the past.

If you are a woman with a dick, or with one that has been cut off when you were a young baby, because of the doctors advice to your parents, though some of you worked off that karma, as well, and balanced it out, etc., you were probably a Lesbianist, in the past, before they trashed you, killed you, grieviously tortured you, ate you, killed you, and with that, you they kicked you out of their organization.

It's the same case for females, as it is for males, almost every one of you, but there are a few exceptions, were a Lesbianist, in the past. The exceptions are the little, tiny people, who live in the

abominated zones, in the pumpkin piggy patches, as I've mentioned about, before. There are other exceptions, but I will not go into them, now, because once you start studying in the 'Managing My Universe' program, you will learn all about who did what, and who ended up where, and so forth. In any case, that is some thing you can look into, later on.

Building An Underground Fortress, Or 'Playroom'

So the nice thing for you to do, would be to make friends with every one, and that goes for the Lesbianists, as well. You should all invite the Lesbianists into your underground rooms, and caves, and culled out work rooms. Culled out means, cut out of the face cliff, or cut out of the wall, or rock wall, or cliff, along side a river, or an ocean, or along a steep mountain face. Culled out work rooms, are not hard to make, but you need to know something about explosives, and blasting, and then, deconstructuring the surface of the cliff face, safely, so that you can little by little, safely, cut out, or cull out, a study, a garage, a work room, a tennis court, a bowling alley, and so forth that you can enjoy under your main piece of property, if you happen to live above a very high and large, solid, granite, or lime stone, etc, rock cliff, far above a lower valley, or river below, or very far above the level of an ocean, or sea, below, and off and aways a little bit, from where your property is located.

Once you begin making an underground, fortress, or play house, if you are a specialist, in explosives, and in architectural engineering, and geological engineering, or if you can get some friends together, who with your combined talents, can manage to cull out an underground fortress or play room, then you can build one, and you can later, after you have installed cold water piping, and drainage, safely, along with installing the electrical power generating facilities you'll need, to keep electrical company employees from snooping around, then you can invite your friends over, and have a block party, with trustable friends, and then you can invite some of the Lesbianists over, and make sure they understand that they are there as guests, on a temporary, but long term stay to teach you all about the molding sciences, and all about sexaling, and so forth, since they are all gifted instructors.

You could always get every one on your block, if they are all trusted friends, to set up a power grid, underground, using the electricity of every one, on the block, to power the underground play room, that you and all your friends will enjoy building. That way, if you build it right, and if you do not raise the suspicion of the power company's meter reader, or meter inspector, or any one else from the power company, who has upkeep maintenance work, to perform, from time to time, then you can safely put in a grid, and hook every one into it, so you can all share in the costs for the mutually enjoyed underground playhouse, along with all the sexaling entertainment, that you will all be able to enjoy, with your many friends, and with their many

trusted friends.

Molds And Donor Bowls

With regards to molds and donor bowl technologies, after you've got your container set up, with a few layers of tin foil or so, on the bottom and sides of the container, and rocks and gem stones, etc., in the bottom, you can use that as a collection bowl, and go around and investigate the molded up breads that you have, and you should have between thirty of forty types of molded up breads, or more, to select from, and when you see some thing, interesting, after a few weeks, to a month, or more, you can pick out an interesting piece of bread, with lots of molds, or with just a few molds, and then you can combine six or eight of the different molded up breads, from six or eight containers, and then just place each slice of molded up bread in the 'donor bowl' container, and then, give it a few days to a week, to get leveled out.

Leveled out means, that the molds on each piece of donor breads, will each spread from one to another of the pieces of bread, and then you'll get a proliferation of molds, on all of your breads, and with lots of molds, it is generally safe to experiment, with a little piece of a corner of a piece of bread. If you cut off a tiny enough piece, you probably will not get too sick, if it is too potent for you to eat.

Try out the different molded up breads, and some may taste gentle, and tasty, and others may not taste to much to your liking, but after a while, you'll get to learn, what types of molds may cause problems with your body, and what types of molds will not cause problems with your bodies, and what types of molds to avoid eating, and what types to enjoy eating.

Molds will continue to grow, one over another, and one day, even though the molds may not be nice ones for you to eat, after a few weeks, and after a few tricks, such as placing those molded breads in with cherry juice, wine, or with sugary water, or with honey, or with fruit juices, fruits, milk, or sour cream, yogurt, or honey and cream, you can get the molds to grow, different molds, that will be more useful to you, and more tasty. There is a lot to study, about molds, and how to farm them, tender them as if they were your gardens, and cultivate them. The Lesbianists know all the secrets about all of this, so we need to convince them to give up the game, and start cooperating.

When you are examining, and sampling your molded up breads, jot down in a note book, accurately as possible, after you've described them to your self, the molds, and every thing about them, and give them names, and take photos of them, and keep a note book, for instance, with the pictures in them, and your notes, so that you can remind your self about what you saw growing, and what you learned about each one.

Technologies To Investigate Molds Gardens

If we had the technologies to investigate the molds, with a powerful enough microscope, that employed the proper technologies, and some computer software programs can be written by persons who know how to write them, and you can attach and adjust a lensing camera to your computer, you can take photos of the molds, and with the write computer program, once it is written correctly, it will be able to do many things, that you did not expect it could to.

They become very complicated to learn about all the technologies involved, but you can get some hints, from Sony, or Pioneer, or Mitsubishi, who have all invested much money into telephoto lenses, and video cameras, and they know all about the technologies that are needed, at least they have them, as classified material, in their documents storage rooms, and you can get copies, if you know the right people, and then you can write your software program, after studying all about the technologies involved, and after you've figured out what technologies are needed, and how to duplicate them, with your computer programing skills and your adeptability.

Adeptibility is a person's being able to know, intuitively, almost, after a lot of study, what it is you need to do, to get the results you want.

Once you put together the software program, you can have your friends use it, and give you input as to how to improve it.

A lot has to do with different types of energies, and how to send them out of the computer, and how to recieve them, back into your computer, and then how to decode them, to get the dramatic effects of being able to see through walls, or hard surfaces, that you never knew you could see threw. A lot also has to do with your ability to make a lensing system, which allows for viewing far away objects, as well as magnifying them, quite a number of times, all while keeping the clarity of the object in focus. You need to be able to light up the object, no matter how far away it is, and no matter how tiny it is, and you need to be able to get the light and imaging back into your camera, or into another camera, or into another pickup input device, a chip on a circuit board, such as an infared circuit board, and then how to drive that energy up, so that it is useful to you, and so that it will brighten up the image, that you recieve, back to your computer, once it has been picked up by your computer's infared reciever device.

It is a little tricky, to get every thing right, but with the technical input the Sony scientists, JVC Japan scientists, Mitsubishi scientists, Cannon, Nikon, and Fujitsu scientists, and paper copier company scientists of Dae Woo, and others, it will not be long before you can put together a computer program, that will sufficiently do what you would like it to do, and that is, investigate the tiny worlds where little worker animals of mine, go about their daily work.

You can even develop similar technologies to see other people, on other planets,if you are adept enough. You can even develop the technologies to be able to see other people on planets that are on the other side of a lot of obstacles, between you and them.

They have many technologies out there, that allow them to see you, and wave at you, but you don't have the technologies to see them, and call them on a video link up, and say hi to them.

You'll need some kind of tracking system technology. To track some one, you need to find a type or types of light energies, and possibly other types of energies, that allow you to bend them.

You also need to be able to pin point those energies, and keep them pin pointed, and on target. You then need to know the technologies involved so that you can lock those energies onto your target. If you can find the types of energies needed, you can get them to lock onto your target, and then they will bend, as you stay on target, and you can get a two way refractor system set up, and the light will come bouncing back to your infrared like energy tracking diode, or whatever it is you use, and you'll be able to lock onto people, far away, as their planet spins, and moves, and as our planet spins and moves, and you will be able to stay on target, and then you will be able to see them, and track them.

You need these pin pointing, and tracking technologies to track the little worker animals, who work for me, as well. You may need a number of other technologies, as well, to make it work, properly, but with help from JVC, Panasonic, Pioneer, and other technical scientists, you should be able to get it to work, without too much difficulty, if you are good at using your brain for these types of fun projects.

You also need to develop the listening capablities, and audio transmission capabilities, but that is not hard, because if you can develop the video transmission technologies, you can easily use your brains, and then, with thoughtful investigation, and research, and with some consulting with the scientists at Bell & Howell, Honeywell, Phillips, and other companies, they all have the information you are looking for, and they can all provide it to you, if you know the right people to ask for assistance at getting to it.

Long Distance Video And Audio Technologies

Rand McNally has already developed the technologies, for this type of software, and so has Phillips Engineering, Hawthorne Publishing Company, and a few other companies, as well, and if you know the right persons, you can find copies of it, and you can get it to work on your home computer, if your computer will run this software. I don't know what format they have programed their software in, but Fortran, or Pascal, and a few others, I think they have used. If you know what to do with it, after that, or if you know some one who would know what to do to get it running, you can invite your friends, and all of you can get the software set up, and then you can distribute it, among trusted

friends.

Eventually, after you have put all the right technologies together, of if you should be so lucky as to get a copy of one of the systems that the companies mentioned, and perhaps others, as well, have already developed, but are not distributing, because the Lesbianists who run the companies, will not allow it, you'll be able to have long distance phone calls with people, far away, on other planets, and you'll be able to see and maybe even speak with practically anything in my universe, if not every body, if you are interested in seeing and speaking to them. The majority of people, nearly, have these technologies, so you'll be able to meet and speak with at least, those people who have the technologies that can interface with the technologies, that you develop.

There are also data bases, here and there, and you can learn from the many friends you can make, in our universe, and from the Lesbianists, how to access them, with the right permissions, and codes, if you can get either the Lesbianists to cooperate with you, or if you can get the people you meet as you go sky surfing, to cooperate with you, and ask them to use a translator program, to help translate their language into your language, so you can hear them in your language.

They have the technologies to be able to decode the languages we speak on this planet, but setting up the software programs to decode their speech, is a little too difficult, as it takes many years to put together, that kind of a system.

Managing My Universes Software, Etc.

If if you get a copy of the 'Managing My Universe' program software, that has the 'Sexaling For A Living' program explained, and many other programs, also explained, in depth, along with lots of useful information, you'll be able to get lots of help, and there are even programs that do these things for you, and you won't even have to worry about making the programs, because all the programs you need to be able to do all the above noted things, and much more, are all included in the software programs selections, for your use, once you join the 'Managing My Universe' program, and once you join the 'Sexaling For A Living' program, and once you swear in, and promise that you will sexal for a living, in accordance with the guidelines for the 'Sexaling For A Living' programs.

It's the new way my kids and I hope you will enjoy earning a living, in the future, as soon as we can get started, with the cooperation of those who have the software programs that I recently had my kids send off to them, using the video and audio surveilance systems, and the work force, they have in place.

The FBI, the White House, Jeb Bush, George Bush, Jr., Barbara Bush, Jr., George Bush, Sr., Barabara Bush, Sr., former general Swartzkoff, former general Colin Powel, Secretary Mike Johanns, Secretary Dirk

Kempthorne, Secretary Carlos Gutierrez, Attorney General Alberto Gonzales, Secretary Robert M. Gates, Secretary Elaine Chao, Secretary Margaret Spellings, Secretary Condoleezza Rice, Secretary Samuel W. Bodman, Secretary Mary E. Peters, Secretary Michael O. Leavitt, Secretary Henry M. Paulson, Jr., Secretary Michael Chertoff, Secretary Jim Nicholson, Secretary Alphonso Jackson, Richard B. Cheney, Joshua B. Bolten, Rob Portman, Ambassador Susan Schwab, Stephen Johnson, John Walters, and others who are Lesbianists working for the President of the United States, will all know where you can get the software, and so please give them a call, and see what they have to say. Your state senators will also all have the software, or at least, they will know where you can get a copy of it. So please try speaking to them, before you busy your self, speaking with the other people, who are just Lesbianists stooges, who are just sitting in their chairs, like on holiday, just thinking who they are going to fuck over next, when, where, and how, before they eat them, while they are alive, and then kill them.

I wouldn't waste my time, too much with them, as they are not very cooperative, because they are all hard core Lesbianists, and they will not budge or flinch an inch, or admit to anything. They will lie, lie, lie, and lie, and that is all they will ever do, or so it seems.

The people on CNN, and on all the major networks, are also all hard core Lesbianists, with few exceptions. These Lesbianists will also just lie, lie, and lie, and they will never get any where near the truth, about nearly anything. They will give you the weather, but that is about all they ever tell you, that is truthful, one hundred percent, or nearly one hundred percent, since they even lie about things to do with the weather, as I noted before, since they call the industrial pollution in the sky, apple meyer, and that is a chemical haze yopu can see hanging over L.A., and Las Vegas, and New York, they helped to cover the planet with, with their petroleum industries technologies, so as to poison your health. They know all the sciences needed to keep them from dying, but they will not teach you the correct sciences, to help keep you from dying, as they enjoy watching all the people they hate, and who they enjoy killing, now and then, suffer. And they joke about you, and they call you, 'rodent rat people'.

They made a movie, the "Planet of the Apes", inspired by you, as they see it, and they continue to mock you, and toy with you, as some kind of chess game piece, and they will continue their silly games, until you are dead and gone, and then they will wait for your return, from my Epcot Center, which I have explained, about, before.

Fibromyalgia, What Is It?

What is fibromyalgia? Well, as far as I can tell, it is the plastics kiddies, from petroleum products, such as your camping mat, or your vinyl upholestry in your automobile, or in the taxi cab, or in your home, the furniture you bought that is covered in clear vinyl, or fake

naugahide, which is a type of fake leather made from plastics.

Naugahide is every where, in vehicles, in trucks, in nearly every automobile, as the seat covers are made from it. It is a type of plastic, that is very comfortable, but it is made from plastics, derived from the petro chemical industry, and from the chemicals industry.

When you sit for long hours on naugahide, little fumes animals, and you can smell them, if you put your nose up to the naugahide, and you can smell, some times, a kind of material, that is similar in smell, some times, to leather, but it is not leather, though the companies that make naugahide, are very clever, and they know many ways to disguise the smell of the plastics kiddies by using different chemical compounds when formulating the naugahide compound material mixture, and the tanning formulas.

It doesn't hurt you right away, but over long months, and some times years, of breathing in the fumes kiddies from it, you will eventually begin to discover that you do not feel well, all the time. You might feel nervous, or edgy, or just uncomfortable. There are lots of people who feel this way, and they do not know why they feel that way, but they just feel that way, and they think, maybe I need some vitamin tablet, or maybe I need to go swimming, or sit in the hot tub, or in a jaccuzii.

Fibromyalgia can be experienced in a myriad of ways. Why is that? It is because there are so many different types of fumes animals, from the petroleum industry, we don't know which ones they are, that are poisoning our bodies, and they all hurt different amoebes animals, cell animals, organs animals, all over, inside of our bodies.

They eat up lots of different muscles in the body. They might eat the feet muscles on the soles of the feet. Or they might enjoy eating your leg muscles tissues. Others enjoy your back muscles tissues. Still others, they don't care too much where they get some thing to eat, and they go any where, in the body, and they eat all over the place, and you get sharp stinging pains, that are very uncomfortable.

We can not see these fumes animals when they are at lunch, eating our bodies up, and the muscles cells kiddies, and the organs kiddies, all over your body. I wonder how many types of fumes kiddies there are from plastics, and also, how many fumes animals kiddies there are, in petrol, diesel, kerosene, gasoline, Coleman's campfire lamp fuel kerosene, motor oil, and in all the petro chemical products, that line the shelves of the groceries stores, in every area of this country, much of Canada, and Mexico, I suppose, as well. I don't know what people in Europe purchase, or in Russia, or in the Soviet Union, or in Bulgaria, or in Serbia, or Croatia, Greece, Latin America, except for maybe some parts of Mexico, I can suppose they use similar products to what we use, in this part of the country, as some Mexican soaps, and detergents, chlorine bleach, kitchen soap liquids, and other products

from Mexico, can be found in some of the local stores, here, such as Kroeger's or Food4Less, Albertson's, Smith's, Walmart, K-Mart, Target, and maybe some others.

I'm sure if we go to an automobile parts store, we can find lots of petro chemicals that we use to wash our cars, or motor bikes, off-road four wheeler bikes such as made by Suzuki, or Yamaha, or Honda, our camper trailer, motor home, or our motor boat.

We are surrounded in petro chemicals, and the air conditioners are puffing them out, despite the arguments of the technicians, who will say, they are safe. They leak out so many fumes, and no one can see how small they are, and many times, you can not even smell them. They build up, and then they begin to smell, when other petro chemical fumes, from the tar in the pavement in the roads, begins to mix with them.

Well, walking around in Las Vegas, we can get the same experience, any time, if we are healthy enough to have a sense for what smells good to our noses. If we are not always breathing in the fumes kiddies, and for instance, if we sit in a park, way out in the country, for instance, with an old log home, and lots of clear skies, and lots of clear running creeks, and streams, and ponds, when we spend some time there, getting our bodies detoxified, by good living, and good healthy eating, and with lots of molds foods, and with lots of ferment brews, and with lots of the healthy things we can make, such as I've mentioned, when we come back into the city, you will think we are entering petro chemical hell on earth.

It is so bad, the smells we have to put up with, and most people become immune to them, after some time, driving around, in traffic, and just thinking, this is normal, haveing the fumes of the buses, blowing into our cars, as they start out at the traffic lights, or the fumes of other cars, blowing in through our car windows, when they pass by, just as they are starting up, or while we are in congested traffic. Los Angeles is a smelly town, no doubt, but Las Vegas is one, too, and so is New York. Washington, D.C., is a smelly town, also.

Any way, even our homes, begin to smell, and we are immune to it, as we can not notice the smells, unless we go and detoxify our bodies, for several weeks, to several months, and then come back, and then try our noses smelling the carpets, the curtains, the bed linen, if made of rayon, nylon, or an other fabric that is not a natural fabric, such as cotton, or wool.

When we go out and purchase home cleaners, such as chlorox bleach, or shampoo, or soap, dishes and glases hand soap, dish washing machine soap, or Ajax, or Spic and Span, or Mr. Clean, Tide, or other product for cleaning the house, bath room, bath tub, shower, clothes, dishes, or whatever, we are bringing into our homes, harmful fumes kiddies in all those products. They escape from inside the containers, because we do not know how small they are. They are so small, they can escape

with out our even knowing it. I am not kidding you.

When they escape, you're going to slowly get ill, and develop muscle and body aches. You can even experience degeneration of ligaments, sinews, tendons, and you can end up with tennis elbow, a bad back, and who knows what else, as these fumes animals eat up not only muscles in your bodies, but they also eat up the ligaments, sinews, tendons, and other fibers in your body, including your nerve fibers, amoebes in your brain, and cell animals in brain structures, and organ animals in brain structures and in nervous system wiring. They eat heart muscles, and just about every thing there is to eat, in the human body, including the teeth, and the sexaling organs, and every thing connected to your sexaling organs.

I mentioned that we have lots of organ animals in our bodies. Well, we have not only amoebes, and cell animals, every where in our bodies, but we have organs animals by the gazillions in our bodies. The fumes animals hardly discriminate, and they like not only muscles, and tendons, sinews, ligaments, cartiladge, nerve fibers, and other fibers in our bodies, but they like to eat the organs animals, the amoebes, and the cell animals, too.

It begins to hurt, with very stinging pains, as far as I can tell, when they start eating up the organs animals. The large the animals in the body that are being eaten up, the more severe the pains, unless you have a lot of animals, of all different sizes, all being eaten up, at the same time.

Well, to cure this, or rather, to stop this, we have to live in log homes, drink water that is not chlorinated, and I mentioned that chlorine is a petro chemical liquid, that is used in jet fuels, and even in some high powered cars, on some planets, instead of gasoline, because chlorine, when it is carefully mixed with other petroleum liquids, and other ingredients, can make a very powerful race car engine fuel.

Next, we have to eat lots of ocean salt and eat a well balanced diet. We need to increase our salt intake, till we use about up to two and a half, to three pounds of salt, to eight pounds of salt, depending on the size of the person, or possibly more pounds of salt, as in the case of the big sumo wrestlers in Japan, and in Samoa, and in Korea, and other places, up to about ten to twelve to even eighteen pounds, or even somewhat more, up to twenty or even thirty pounds, each year, for the large sumo wrestlers, who have lots of problems with fibromyalgia pains. One sumo wrestler, who weighs about eight hundred pounds, needs about forty or more pounds of salt, easily, each year, for helping him with his fibromyalgia pains, to kill the fumes animals in his body.

Some people may get by on less salt, if they do not have severe problems with fumes animals, i.e., fibromyalgia animals, but for most people, you need to increase your ocean salt intake, and not use

iodized salt, as that will worsen your problem, as it is poisoned with petro chemicals, and no one tells you, and it is not on the label.

If we increase our ocean salt intake, we will get over fibromyalgia, in time. To repair our bodies, is more difficult, once you have increased and maintain a steady high level of ocean salt, in your body, daily. If we let it drop, we can get ill, once again, if we inhale fumes, animals, and they are in the carpets, and in the curtains, and in the ceiling tiles. Don't be fooled. The Lesbianists put fumes animals in every thing they possibly can, since they want to make you suffer.

They know they only need to eat lots of ocean salt, and they laugh at you, when you get sick, and when you suffer, and when you can no longer work, like many fire men, and fire women.

When we have a house burn down, there are so many fumes animals that are let loose into the air, we should just run for cover, and forget about putting the fire out, as we are certainly looking for health problems, though we do not know it. There are many fire men, and fire women, who are so ill, they can not get up in the morning, and no doctor knows what their problem is. Well, it is simple. They inhaled so many fumes animals, their bodies are being eaten up, from the inside out, and the Lesbianists just laugh at them.

Asking The Lesbianists For Specific Information On How To Repair The Damaged Animals In Our Bodies

To repair the damage to the organs animals, and to the amoebes, and to the cell animals, we can ask the Lesbianists for information on the types of molds they use, to help them help their organs animals, and other animals, repair themselves.

When there is a big forest fire, the government calls out soldiers, and others, such as national guardsmen, and national guards women, and soldiers from many marine bases, or army bases. Professional fire fighters are also called to the scene, and they pitch in, and try to put out forest fires.

It is really perverse, when you think about it. The natural woodlands must burn down, to then regrow. Nothing is hurt, as trees have roots that are so deep, and that go off in many miles in many different directions, so long as there is a stump to that tree, above ground, that is all that is needed, for that tree to regrow, within a few hundred to a few thousand years, depending on what type of tree it is, and where it is growing.

That is silly, isn't it. Well, what is worse is that the Lesbianists tell the fire fighter crews to put the fire out with petro chemical flame retardants, they either spray on, from a short distance away, or that plane and helicopters over head, drop onto the fires, and burning trees, and shrubs, below.

The fires eventually return, with in a few years, some times, and guess what. All those petro chemical flame retardants get burned up, and the fumes make the fire fighters so ill, many of them simply die. You do not hear the statistics on the number of deaths among fire fighters, but there are many, and they are often times, military soldiers, who die, and the family gets a note that their son or daughter died, and little else is said about it, except for the information on the funeral. This is ridiculous, and it needs to stop, right now.

However, there is a problem, here. We all have karma. This is some thing that we can not get around. Many people do not know what karma is, and many people do not believe in karma.

Well, that's up to them, but the truth is, there is some thing I call karma, and it is just a record of all your good behavior, and a record of all your bad behavior. I am a sneaky guy, and I have my kids record your karma. And you can argue about it, all day if you like, but that will not mean anything, because my kids are always recording your karma, whether you like it or not, and whether you believe it or not.

Now how are you going to deal with that karma? Well, you can keep going through one life time after another, being made fools of, by the Lesbianists, or you can start sexaling, and you can try to practice my religion, as I've explained about it, on my bulletin board. When you start practicing my newest religion, you can begin to get your karma straightened out, and soon, after many gabillions of years of practicing my religion, slowly, people will stop making fools of you.

That's how serious it is, your karma. Until you work on erasing it, and it takes a long time to erase, because we've all been here, in my universe, longer than any one can possibly imagine, and we have so much karma, it will take us nearly eternity to erase it all.

There is more to karma, than that, and you can study and learn about it, once you join the 'Managing My Universe' programs, and once you join the 'Sexaling For A Living' programs, which I've mentioned a few words, about.

Until you erase your karma for being made a fool of, by these Lesbianists, and for being made a fool of, by your friends, and family members, and school teachers, and by others, you won't really be able to be happy. There are lots of things we need to erase our karma for. Not only for being made fools of, but also for just being bad people.

What Is Our Job, From Now On, In My Universe?

We have been so bad to each other, over the many kazillions plus years, we have been living in my universe, life after life, and no one can count how long we've really been here, as it is just too long. All that time, even from the very begining, when we first got here, and began living in my universe, it wasn't long before we started acting, badly. That snow balled, and now we have so much karma, it is just ridiculous.

Anyway, that's our job from now on, and you and I are all going to get to work, erasing our karma, and learning about karma, and learning about how things work in my universe, and in time, we will begin to understand that, truly, indeed, our main job here, in this big bus station terminal center, as I've called it some thing like that, before, is to erase the karma that my kids, as well as us, produce.

It is our jobs to erase it, by practicing my religion, and by sexaling, religiously, in time. In the begining, you will not think that sexaling is a religous act, or a religious activity, but it is, and as the kabillions, and katrillions, and kazillions of years go by, eventually, you'll begin to learn, and so will I, that sexaling is a religious activity. When people say that, I'm sure they must have a smirk on their face, as no one thinks that sexaling is a religious activity. Well, we can smirk all we want to, but in time, we will learn that sexaling is indeed a religious activity. It will take a lot of time, and a lot of experience, but after who knows how many years, eventually, we will get brighter than we are, in the head, and we will begin to understand that sexaling is a religous activity, just like praying is. There are many religious activities, many people will think, 'Oh you've got to be kidding me!', but one after another of them, in time, you will learn that they are religous activities. I've mentioned about some of them, before, and people smirk, and laugh, and giggle, and no one takes me seriously, but that is to be expected.

In any case, in time, we will see that these activities are all religous activities. In the mean time, no one really cares, I don't think, as so many people will just enjoy sexaling, all the time, or some of the time, as some people are not physically able to enjoy sexaling, with others, as it is their karma to not be healthy enough to enjoy sexaling with others.

There are people with nervous system problems, and there are handicapped people, and elderly people, and people with all kinds of disabilities, who do not like or even think of sexaling.

In time, we will all get our karma straightened out, and we will work to erase it, as the years go by. In time, more and more, people will get healthy, once again, including me, and in time, people with fibromyalgia, and with other nervous disorders, autism, and all kinds of health problems, and physical handicap problems, they will all get better, and they will all learn about rejuvenating their bodies, and in time, we will all be living forever, in my universe, erasing our karma, and the karma of my working children, who do not have the time to work on it, themselves.

Erasing karma will be our main job, as there will always be lots of it to erase. There are my many worker animals in my universe, and who will erase their karma? We will. Every one who works for me, will give me some of their karma, and it will be up to us, the people living in this main central bus station terminal, to erase it.

Why are we stuck with the job of eraseing it? Because that is our only job. My kids have many jobs, and they keep my universe going. Now, with my religion, to help us, you will spend your energies, for eternity, working for me, and erasing the karma of my kids, and of my many worker animals. Other wise, our universe will not run well, and it will collapse, and come to a halt, and then we will not have any place to live.

You will all learn more about all of this, once you join the 'Managing My Universe' programs, and once you join the other programs we have, including the "Sexaling For A Living' programs.

Don't try this at homes with 240V AC, kiddies!

...even though it works if you pick a lower wattage bulb to keep the
charging current down. Not a good idea really. :-)

I've used series lamps a few times when testing "unknown" valve gear as
it helps keep the "holy smoke" inside the transformer box. Cheaper and
less noisy than fuses.

I use a variac and monitor the current as I turn it up.

I used to have a pal called OXO, Jim G6EQK, who used to use something of a
similar device to the 3 dollar battery charger on TV tubes when they went
flat.

> intestines, that go to one side and then downwards, and then side
> ways, and so forth, as depicted in this particular picture, of the so-
> called large and small intestines.
>
> Please see, "Anatomy of the Large And Small Intestines"
>

> http://medpics.findlaw.com/generateexhibit.php?ID=1696&ExhibitKeyword...
>
> A similar faked drawing of the tummy tube, or shank, the descending
> colon tube, which is titled "intestines", along with a faked stomach
> drawing, by the Lesbianists and their bogus 'medical' establishment,
> can be found at:
>
> http://medpics.findlaw.com/generateexhibit.php?ID=23&ExhibitKeywordsR...
>
> Another bogus drawing of the abdomen and the supposed 'intestines',
> can be found at,
>
> http://medpics.findlaw.com/generateexhibit.php?ID=13860&ExhibitKeywor...
>
> These pictures, and all other pictures like it, are totally bogus.
> There are no guts, bending and twisting to one direction, and then to
> another direction, that eventually find an outlet at the poop hole in
> the human body.
>
> Chimps, apes, and monkeys may have these types of stomach 'tripe' that
> is longish, twisting to one side or to another, going back and forth,
> and then wrapping or folding down under other tummy tubes, and then
> twisting in and then moving outwardsly, as chimps, apes, and monkeyes
> live on banana foilage, twigs, seeds, hard shells, and other difficult
> to eat, hard, rubbery, plant roughage, of one kind, or of another.
> Some oselots may have this kind of tubeing, and so may many other
> animals, but not the human being.
>
> In the human being, there is in reality, no such guts or tripe
> tubeing, and there is what is called a 'shank'. A shank is the human
> being's tummy tube, or the desceding colon tube.
>
> Your tummy tube descends from the front right side of the tummy, in
> the near to upper to middle to near lower area or section of your
> tummy, depending on the person. Some people, may have their tummy
> tube, the ejector pipe, also called the descending pipe, a little
> higher up, than other people. Some people may have their ejector pipe
> a little lower than other people. That is not significant.
>
> The muscles inside of the tummy, and surrounding the tummy, cause a
> pushing motion, to eject the tummy food, that has made its way to the
> back side of the inside of the tummy, and to the lower or middle area,
> near the eject pipe, on the inside of the tummy. Once your tummy food
> makes it there, the muscles begin to squeeze on it, and the muscles on
> the inside and on the outside, squeeze on it, and force it up and out
> of the ejector pipe, and down a chute, or the descension colon pipe.
>
> The descension colon pipe goes in a nearly straight line, almost
> perfectly straight, in some people, directly to the out put terminal,
> which is the poop hole.

>
> The intake for food and beverages from your lips, mouth, to your
> throat, or food pipe to connect your mouth to the tummy, that
> connector location is on the top side of the tummy, on the left side
> of your tummy, as you face forward. There is a tiny amount of terminal
> area, that's your stomach area, that is the terminal area, on the top
> side of the tummy, that is to the immediate left of the intake tube
> terminal entry way, itself. That means, there is a descending tube
> from your mouth to your stomach, and it connectes to the left side of
> your stomach, not all the way to the left, but nearly all the way to
> the left side of the stomach, but on the top, generally, and in some
> people's cases, it is a little down, from the top, less than an inch
> or two from the top.
>
> So the intake tube from your mouth sort of goes in to your tummy, from
> the front of the tummy, a little lower than from the top side edge of
> your tummy. The top edge of your tummy is located just about at the
> same height as your titty nipples are located on the chest. The little
> inwardsly pointing, dimple, in the middle of your chest, a very large
> dimple, just above where the rib cage begins to open up and spread
> apart and where the tummy muscle cavity can be felt, that dimple, or
> inwardsly pointing cavature, or the caving inwardsly of the chest
> bones in that area, some times slightly below, sometimes slightly
> above that point, is where the tummy's top edge is found. The tummy's
> top edge runs horizontally, more or less, across from one side to the
> other. It does descend at the outer edges of the tummy, to form a
> pouch system.
>
> A bogus drawing of the Lesbianists' pretend 'esophagus' for all the
> med school students to ponder over, and of a pretend tummy, which has
> the connections on the back side, where they are not located, but on
> the front side, where they are located, can be found at,
>
> http://medpics.findlaw.com/generateexhibit.php?ID=4599&ExhibitKeyword...
>
> The tummy does not look like a cashew peanut, like in the drawing. It
> is a pouch, and it is more oval in shape, kind of like a box, but a
> little long or rectangular, some may say it is similar in shape to a
> peanut, or to a raisin, or to a plumb, and it runs lengthwise from one
> side to the other, with the narrow part of the oval running
> horizontally. It is nearly a perfect, very slightly long, oval in
> shape.
>
> The descending colon pipe, your tummy tube, which goes nearly in a
> straight and almost perfectly vertical, in many cases, direction, to
> your poop hole, from the ejection outlet port of your tummy, which is
> on the front side of the tummy, on the front right side, as mentioned
> above is very long, and in some women, the tummy rests slightly higher
> up, a tiny bit, to allow for a longer 'shank', or sexaling tube.
>

> What Is The Shank?
>
> The shank, if we look at the opening and entrance to the shank, the
> butt hole entrance, the shank is a multiple duty, instrument. It is a
> nearly straight tube, and it allows food to exhaust from the tummy
> pouch. It also allows a dick to be placed up into it from the rear
> upwards, and a dick can be very long, in some cases, and there for,
> the tummy tube, or shank, is very long, and also, importantly, it is
> generally straight in most women and girls and in lots of men and
> boys.
>
> Discoloration Of Sexaling Organs
>
> If we look at the dick, or if we look at the scrotum, we will see it
> is a darker, slightly discolored body instrument. The vagina is
> slightly discolored, and so are the titty nipples. So are the lips,
> the inside of the mouth, the throat inside, and in various other
> places, depending on the person. The palms of the hands, the
> undersides of the fingers, the soles of the feet, the toes, the ears,
> the cheeks, and the underarms of people are all discolored to one
> extend or another. The discoloration is an indicator of the fact that
> these sense organs, or love making instruments, are major sexaling
> instruments. The other organs of the body, are minor sexaling
> instruments. All of them, are sexaling instruments when you activate
> them, by massaging them, and by rubbing them, and so forth, and they
> will begin to shoot off energies, and those energies will purify and
> holyfy your life and clear up your karma and the karma of the people
> around you as those energies will shoot out in all directions cleaning
> up my universe, as they go zinging outwards. The energies will erase
> your karma, over time, and if you pray with a prayerful minded
> statement in mind, while sexaling, your karma that is related to that
> prayer, that needs to be erased, will get erased, little by little.
> For examply, "I pray that I will be able to have the good health and
> prosperous life, that will allow me to live, comfortably, and without
> distress."
>
> Sexaling And Prayer Statements
>
> The negative karma that you have, that would prevent you from living a
> healthy life, that is also prosperous, and without distress, will
> slowly, over time, get erased, as you make your statement, every time
> you begin sexaling, or every time you begin a sexaling session. If
> your sexaling sessions are going to go for days, say, three to eight
> days, for instance, you might want to repeat the prayerful minded
> statement, every eight to twelve hours, to fifteen, to thirty, to
> fifty hours, or so, to 'freshen' it up, once every so often. The more
> you freshen it up, the better it will work. The prayer will apply to
> not only you, but to every one else who is sexaling, if you say, "I
> pray that I and every one else will be able to have the good health
> and prosperous life, that will allow not only myself, but all other

> people, as well, to live without distress." This statement is a
> bodhisatva minded statement, and it will produce better results.
> Prayer statements said with others in mind, in addition to your self,
> produce better results, as a general rule. Why is that? Because we
> want to purify not only your karma, but every one's karma, and you get
> extra points for thinking about every one else and their needs, as
> well as your needs. Not only your self, but every person who is
> sexaling, during the time you are sexaling, and during the time, you
> continue or plan to continue sexaling, as one long sexaling session,
> will benefit from this prayer statement.
>
> The Butt Hole Sexaling Organ And The Shank Sexaling Organ
>
> The butt hole is also discolored, in all human beings, and that is an
> indicator that the butt hole is a sexaling organ.
>
> The discoloration of the butt hole entrance, is an indication of the
> fact that the butt hole entrance is a sexaling organ. If we look
> inside the butt hole, we will notice that the entire length of the
> 'shank' is discolored, and therefore, the entire shank is a sexaling
> organ. Sexaling organs are different in coloration, than the normal
> skin coloration of the body.
>
> The discoloration is due to the fact that there are a gazillion plus
> tiny blood carrier veins and arteries, that are very tiny, so tiny,
> you can not see them with today's 'current' medical microscope
> technology that is in the hospitals and labs, used by doctors,
> scientists, and lab technicians. These tiny blood 'capillaries' or
> fluid flow ductways, are too small to be seen by a doctor's
> microscope, or by a lab technician's microscope. These fluid flow
> ductways, or capillaries, are all clustered together, in high
> densities. When they cluster together, that is for a purpose.
>
> They are clustered together in high densities to allow for fluids to
> flow to the nerves in that area of the body to feed all the mouths in
> the nerves of that area of the body. There are clusters of sense
> nerves that are extremely dense, in all the sexaling organs. Where
> there are high densities of sexaling nerve clusters, there are lots of
> fluid flow ductways, or capillaries, and the area of the skin that is
> visible to your eyes, will show a slight to moderate, to heavy
> discoloration, due to all the fluids flowing through the area,
> carrying food and nourishment.
>
> Nerves
>
> Nerves are organs in them selves. The smallest nerve organ is a nerve
> cell, perhaps. My memories are not very good, so we might find smaller
> nerve organs, as my memories improve. A nerve cell has all the organs
> in it, to allow it to function as a normal, living being. That means,
> it is alive, and it thinks, and it cogitates, or mulls over thoughts,

> and it considers, for instance, 'What am I going to do, now', and it
> has lots of thoughts, and it stays busy doing lots of thinking, and by
> doing lots of cogitating, and by doing lots of communicating with
> other nerve cell organ kids of mine.
>
> Nerve Units As Living Beings, I.E., Creatures
>
> Nerves, just as nerve cells, form units, and as a unit, they form a
> living being, or creature, and all of them have mouths, since all my
> creatures have mouths, and they all need to be fed.
>
> The sense nerves, the erotic nerves that are clustered together, need
> to be fed the foods and nourishment that they need to be healthy and
> fit, so as to be able to respond, to stimulus. They need to eat to be
> healthy, so that they will then be able to respond when stimulus is
> applied to that area of the body, where they are located.
>
> Each organ in the body, has a brain, and a mouth, and a stomach, and a
> poop hole, and a pee hole, and all the other organs they need to
> survive with.
>
> Some organs, maybe all of them, need to feel comforted by other
> organs, i.e., creatures of the same kind as they are. Some organs like
> to not only speak to other organs creatures who are like them, but
> they also like to snuggle up to one and another, and they get cozy
> with one and another, all snuggled up, suddenly, before any one new
> it, pwoop, and they make a baby organ or creature who looks like mommy
> and daddy.
>
> Organ creatures of course can sexal, because if they could not, they
> could not make baby organ creatures. Organs can sexal just like human
> beings can sexal, but they sexal in their own particular ways. They
> like to sexal, just like human beings like to sexal, and they also go
> ouch, when some one or some thing pokes them, or pricks them, such as
> the doctors needle at the doctor's office.
>
> Each nerve cell is built with all the organs it needs to survive, and
> each organ is built with all the organs it needs to survive. The
> number of organs in the human body is almost limitless, but not quite
> limitless, as you can still count them, all, if you have the time.
>
> Brains And Notational Thoughts
>
> Each organ is a living being, or creature, with a brain, and with
> notational thoughts. Notational thoughts are memo types of thoughts,
> such as about, 'oh, boy, that sure felt good', or 'golly, gee, I am
> really bored'.
>
> One notational thought, for instance, that is of use to you, is when
> you are in need of water, and you begin drinking water, when you get

> the feeling that you need lots of water, and you get a message to your
> brain that you are in need for water, because you know you are low on
> water, and almost out of it, well, the inspirational thought that
> tells you, "keep drinking, keep drinking, you are too low on water"
> that is an inspirational thought, that your tummy and its brain is
> passing on to an area of your conscious mind, where you can then pick
> it up, and then act on it.
>
> There are many kinds of notational thoughts organs can have and organs
> can pass on to our 'brains'. Organs, as living beings, also do lots of
> chit chat with other organs, not only with the organs inside of your
> own body, but also with the organs inside of the body in other
> animals. Brains are brains, and they are very smart, if they are to do
> the duty they are assigned to do, which requires them to be smart.
> They are so smart, they spend a lot of their time, communicating and
> chatting with other organs, to see if every one is alright, and to
> find out what the latest gossip is. They can do many things, and that
> is the topic for another time. But one thing they can do is talk to
> each other. They have their own languages, they speak to each other
> with. Did you know that? I bet you didn't. If you are a Lesbianist,
> you may probably know this, as you probably studied about it, in your
> school days. Some kids, five or six years old, study these things, on
> planets, where education is up to the standard, that I set it at.
>
> If we understand that brains are in every organ in the body, and some
> organs, have multiple brains, almost all of them do, and if we
> understand that they are able to communicate to each other, than we
> can understand that the vagina is a living being, and it has a brain,
> and it talks with other vaginas, in other women and in other girls.
> The dick has a brain, too, and it talks with other dicks, and it talks
> with vaginas, as well, when a vagina calls to a dick, and asks it
> questions.
>
> Feeding The Organ Kiddies The Foods They Need
>
> We need to feed the body, many foods, not only tomatoes, potatoes,
> asparagus, meat, and fruit, etc., but we need to feed foods to our
> body for feeding the organ kiddies, the organ animals, the living
> beings, or creatures with brains, called organ kiddies who are inside
> of our body.
>
> What are we doing when we feed the body? We are supposed to be feeding
> not only our face, loading food in that tastes good to us, and to our
> sensibilities, but we are also supposed to be feeding the animals that
> live in side of us, as well as, we are supposed to be feeding the
> organ kiddies, who also need food to stay alive. We also need to be
> feeding all of the other animals kiddies, the living creatures of
> various kinds, that are living inside of our bodies. Most organ
> kiddies are on a starvation diet, nearly, and they survive on nearly
> only water. Some are lucky and get some pee and poopy juices from

> animals that live inside of our bodies.
>
> Most of the organ kiddies are not lucky, and they languish, from day
> to day, with nothing to eat, and they hang on, and they do their best
> to perform for us, but in the end, they are defeated by our not
> feeding them, and they give out, and give up, and throw in the towel,
> and say, "To hell with it. I don't care anymore." and with that, they
> cancel their agreement to work with us, and they say good bye, and
> they then slowly perish, and as they do, so do we. We perish because
> we do not feed the organ kiddies in our bodies, and because we do not
> feed the cell kiddies in our bodies, and because we do not feed the
> amoebe kiddies in our bodies. If we feed them all, we would not die,
> and they would continue to live, properously, and progenerate, or give
> us babies, to take over the jobs of mom and pop, Sr., the first organ
> kiddies in our bodies, who want to work with us, and who want to be
> fed, while they work for us, when mom and pop, Sr. are near the end of
> their run, that is their work life, and when it is time to call them
> in to my Epcot Centers for them, for them to get their check up, and
> repairs that they need, to their brains, and to their nervous systems,
> and to relieve them of any undue or unwholesome stresses, nervous
> tension, migraines, and so forth.
>
> You might be thinking, "This is a joke", but it is not a joke. You are
> completely wrong if you think this is a joke. If you feed the foods
> that organ kiddies like to eat, to them, they will become alive with
> activity, and they will work hard for us, and we will feel a new sense
> of vitality, and we will regain our good humor, to some extent, as it
> is a karmic issue here, as well, having a good humor, or a pleasant
> personality, and when it is time for mom and pop, Sr., organ kiddies
> to pass on the work load to baby Mac, and baby Sarah, organ kiddies,
> Jr., they will pass on the work load to them, and Poppa and Momma will
> retire and make their way, with assistance from their kids, and with
> assistance from my kids, to my Epcot Centers for them.
>
> This is a complex topic to discuss, and I won't try to discuss it in
> full, obviously, as I am too stupid, and my brain is not working, and
> I can't remember every thing about it, obviously. But, you should
> know, that if you feed them the molds animals, the molds fruits and
> gardens produce, and the funguses they like to eat, and that they
> enjoy eating, and the other foods that they eat, from fermented mash,
> made correctly, and from molded foods, and from molded breads, molded
> chesses, properly cooked meats, and so forth, they will feed on the
> animals in that food that you prepare for them, and you'll get
> healthy, and they'll get healthy, and they'll live for three hundred
> to eight hundred to fifteen hundred years, or more, depending on which
> ones you are talking about, and they will work for you, with zest and
> vigor, before it is time to hand over the work load to baby Mac, and
> baby Sarah, organ kiddies, Jr.
>
> If We Were Able To Be Born With "Owner's Manuals" For Our Body And

> Brains
>
> We are not born with an owner's manual for our body and brains, etc.
> If we were born with one, we would be told that if we feed our body
> properly, the body will last us forever, and we will be able to live
> forever. This is the norm for the human body. It is not a 'dream' or
> 'hope', or 'wish'. It is merely the truth, and once you learn how to
> feed your body, and all of the animals and creatures inside of your
> body, you will begin to make all the animals and creatures inside your
> body, happy, and they will begin to work for you, as they were
> intended to work for you. They are all my worker animals, and they are
> here to work for me. I have many worker animals, and we will learn
> about all of them, and we will find those who we need to help us feed
> our bodies properly, so that we can all live in the body that we were
> born in, that is meant to last you forever, if your feed it and
> nourish all of the animals in it, properly.
>
> If you do not feed my worker animals in your bodies, the nutrients,
> the animals and the plants animals and the foods that my worker organ
> animals in your bodies like to eat, that will allow my organ worker
> animals, and all of my other worker animals, to live with vigor and
> tenacity, strength and good health, they will not work very well for
> you, and in time, they will all perish, and so will you. I mentioned
> my worker animals in the molded foods, molded fruits, molded citrus
> fruits, fermented beverages, and so forth, that we will be making.
> They are all there in those foods that we will make, and then use to
> feed ourselves with, to then help feed all my worker organ animals, my
> worker cell animals, and other worker animals, that are in your body,
> and that need to be living in your body, working hard for you.
>
> If you do not feed them the foods that they like to eat, they will not
> live for long, and they will perish, and die, and that will be that,
> and you will not have a chance for living more than a hundred or two
> or three hundred years, in that body of yours, if your karma is good,
> and if you were not being poisoned by the petro chemical industry, and
> the chemicals industries, and by the foods manufacturing industries,
> and by the pharmaceutical manufacturing industries. We will never hear
> the Lesbianists admit that they are intentionally poisoning us, but
> they are.
>
> Once you find a way to survive on molded up, wholesome natural healthy
> foods, with no pesticides, and on water that is not chlorinated, and
> that is wholesome to drink, and after you learn the abc's of proper
> eating, to feed every one in your body, as well as you, then you will
> not die and you will begin to live forever.
>
> The Lesbianists are afraid that you will learn to eat properly and
> then, when you begin to get your diet together, not only for your self
> but also for all the animals and organ kiddies in you, and for all the
> cell animals in you, or cell creatures, who are smart living beings,

> by the way, you will begin to be able to extend your longevity, and
> then, in time, you will be able to live forever.
>
> If you stop drinking the poisonous coffee in the office, as I've
> explained about, previously, the Lesbianists make it with diesel
> fuels, and with gasoline, and with kerosene, if you stop smoking the
> poisoned cigarettes, if you stop using the plastics furniture, and
> other plastics products, if you stop inhaling the gasoline fumes
> kiddies that cause fibromyalgia, and fumes animals cause the sharp
> pains in the body as the fumes animals eat up and destroy the organ
> animals in the body discharging energies or electrical currents, as
> they mate, and as they sperminate, and vagicate, or eject female
> animal sexaling juices, like some jelly fish do, and like some deep
> sea snakes, and worms, that are lit up, with pulsing lights in them,
> when they mate, do. Fumes animals also cause arthritis, ligaments
> problems and diseases, and other health problems. If you stop inhaling
> the plastics fumes kiddies, which also give you fibromyalgia,
> arthritis, etc., and kill brain cells, and cause brain rot,
> Alzheimer's disease, and parkinson's disease, and a number of other
> illnesses, and if you begin to eat properly, in accordance with the
> proper rules for diet, that our body and brain owner's manuals would
> explain about, if we were to be born with these manuals at the time of
> our birth, then, you will begin to get healthy, and you will begin to
> live forever.
>
> So, good luck, and do not vote for Hillary Clinton, or any of the
> other presidential candidates, and if you see them, give them a beaver
> cheer, some people call it a 'Bronx cheer', and the noise you make
> sounds like someone farting in their direction. That may sound
> childish to say, but it is what the Lesbianists deserve as you are
> being played for a fool, every day of your life, and you should snap
> out of it, and do some thing about it, as soon as you and your friends
> can get it together to begin sexaling, in the ways I've explained
> about.
>
> Duplicator Tests
>
> In a duplicator test, there is one strand of a piece of the body, and
> you take that strand, and with medical and scientific technologies,
> you attempt to make a copy of it.
>
> Why do they make a copy of a strand of a piece of a human or ape,
> monkey, dog, or cat, etc., body?
>
> To test for various possibilities as to who the strand came from and
> how the strand came from the source, and what has happened to the
> person, if it was a person, if the person is no longer here to stand
> in for himself or for herself, in the case of a missing person, for
> instance.
>

> What is meant by a strand of a piece of a human, etc., body. Usually,
> a piece of flesh is a good place to start. A clipping from a person's
> finger nails, can be duplicated, if the sample is tiny enough, and it
> can be analysed, and then compared with an original shard or piece
> from a person's finger nail, a known subject's finger nail, and then a
> match up can either be made, or not be made.
>
> Human blood cells can be duplicated and matched. Human skin tissues
> can be duplicated and matched. Human organ tissues can be duplicated
> and matched.
>
> These matching tests are in fact, one example of a organ animal
> giveing birth to a baby organ animal, or to a number of baby organ
> animals.
>
> I'm not sure what they call the test, in the laboratory, but that is a
> duplicator test, in my vocabulary, and it should be a simple test that
> all county, municipal, and other police medical technical labs,
> forensics labs are capable of performing.
>
> This example of a matching print from the one strand of a piece of the
> body, is an example of organs animals, giveing birth to baby organ
> animals.
>
> Red blood corpuscles, are often tested, in this manner, I believe. A
> corpuscle is an organ animal, and it will give the same results, and
> you can make baby blood corpuscle organ animals.
>
> A high school, or jr. high school science lab technician or teacher,
> or in some school labs, including jr. college science labs, and
> technical labs at medical technical schools, teaching assistants,
> should be able to perform this test as it is a simple test to learn
> how to perform, and even off duty police officers, are taught it, in
> their free time, for fun, or for advancing their career. Licensed
> Practicing Nurses (LPN's) generally know about this test, and so do
> all doctors as well as your general medical school student, and two
> year college, or four year college, nurses course students. Botanists
> know or should know this test, and there are many professions where in
> this test is common, such as in paleontology, the study of human
> remains, bones, and so forth. I don't know what people on this planet,
> understand a paleontologist (Note: 'paleo-entologist' I think may be
> the correct spelling, but I'm not sure) as, but in my vocabulary, as
> it is comming back to me, a paleontologist explores and investigates
> old bones, fossilized bones, old grave sights, and so forth.
>
> Elementary school students, and maybe some kindergarden school
> students, in advanced kindergarden schools, such as in Japan, and in
> Europe, and in different countries around the world, can do this test,
> if their science lab teacher lends them the technical books, and tools
> to take home, study, and then show the family and parents, how a

> duplicator test is done. It's not a difficult test to perform, if you
> can read, and if you know what a beaker is, and so forth.
>
> This will give you a start for the search for proof as to whether or
> not there are organ animals in the human body, and in all animal
> body's and in all living being's bodies. It will provide proof that
> organ animals, once you've identified them, can in fact give birth to
> baby organ animals.
>
> There are a number of types of duplicator tests, lab technicians
> perform, in their day to day job routines, in medical labs, and the
> duplicator tests are generally for making comparisons, of one type or
> another, or for one reason, or another. They all give the same
> results, they provide you with proof that organ animals do exist in
> the body, and that organ animals do make babies.
>
> Sexaling With Family And Friends
>
> Sexaling with your family, relatives, trustable neighbors, and so on,
> will help you to begin to erase your karma, if you begin your
> wholesome, purifying, and holyfying sexaling with your family,
> relatives, kin, trustable neighbors, and others who are trustable. As
> you erase your karma, little by little, you will begin to get better
> karma, and you'll begin to be able to get rid of these Lesbianists who
> make fools of all of you, and who toy with you, one life after
> another, as you go into my Epcot Center, and then come out again, as a
> tummy baby to a tummy mommy and to a tummy daddy, on a fairly
> predictable basis, meeting up with your former friends and colleagues,
> over time, and then going through the six, or ten, or twelve, or
> forteen, or sixteen, etc., years of schooling, each time you come out,
> to lead a very short life span, with, once again, all of your organ
> kiddies and other animals and living creatures in you, nearly starving
> to death, the whole time you are out here, with your friends, playing,
> golf, swimming, playing tennis, football, entertaining the
> Lesbianists, and so on, until it is funeral time, and then back, once
> more and into my Epcot Center, until a new tummy mommy and a new tummy
> daddy, are waiting and ready for you to come out again.
>
> This is not a joke, I need to repeat, and you should start thinking
> about doing something to bring a stop to this abuse of your organ
> animals and other living creatures in you, and to bring a stop to the
> abuse of you, by the Lesbianists who will not tell you how to do any
> thing that is good for you and that is good for your health.
>
> Massaging The Butt Hole And Shank
>
> If you work massaging the butt hole for a few hours, fluids will begin
> to form, and the tissues of the shank, and of the butthole, will
> become more pliant. They will become stretchable, and they will, after
> a number of hours of massaging the butt hole, and the inside of the

> butt hole, little by little, as you insert a dick up the hole, as it
> gives way, and becomes more pliant, after a few hours, or so, it will
> soon be able to become opened up completely, and a dick can then be
> inserted and the shank then becomes a sexaling tube.
>
> On the end of the dick, there is a 'pooper scooper', or head level
> scoop pipe. The head level scoop pipe is the peculiar shape of the
> dick at the tip of it. This shape allows you to insert the head of the
> penis into the butt hole, and then take a wee wee, and then mush up
> all the food that is stuck in the cavity, and after a little mushing
> up of the food in the tummy pipe, or shank, you can then begin to
> scoop it out, little by little, with one dick shovel head, after
> another.
>
> After seven or eight dicks, to twelve to thirteen, or so, on the job,
> pumping, and peeing, and scooping out the poop, and ejaculating, as
> well, you can eventually scoop out most of the poop from the shank.
> Some may remain near the top, so a few more pee pee's into the butt
> hole, will help wash out the tummy tube, and it will become clear and
> free of digested food matter.
>
> The large and small, i.e., the meaning or intent of this paper, or
> note, is to let you know that the poop hole is a sexaling organ, and
> that the poop tube is a straight tube, and not a twisted up, bundled
> up, chimpanzee, or oselot guts piping, or bear guts piping, or horse
> guts piping, or pigs' guts piping, or cows' guts piping, as the
> medical community, would like to have you believe, along with the
> hoards of bible thumpers, who colluded with the Lesbianists of the
> medical community, to keep you in the dark ages.
>
> You are being played for a fool, every day of your life. If you can
> allow the Lesbianists to make a fool of you, every day of your life,
> and if that is alright with you, than go right ahead, and play their
> game, and let things stay as they are, but if you are not willing to
> allow them to make a fool of you, then you had better get busy,
> sexaling, and so forth, as I've already told you what we need to do,
> to help bring about the changes we need to make.
>
> Sending Hillary And Obama On Their Final Rides
>
> A vote for Hillary Clinton for president is a vote for stupidity, on
> your part. A vote for Obama for president, is a vote for stupidity, on
> your part. Now why doesn't somebody kill Hillary Clinton, or Obama, or
> both. I just do not understand. Do you? I don't.
>
> Next time you see Hillary, you can ask her if you can open up the
> front of her chest cavity, and take a look inside to see if she has a
> shank, as I described it, or if she has a twisting and turning, animal
> type set of guts, like many animals do. I think you'll find that she
> has a 'shank', and not a twisting, turning, animal set of guts.

>
> All human beings have shanks, and not one human being has a set of
> 'animal' guts. Human beings have shanks for fuckaling, that is, butt
> fuckaling, but no one, except the Lesbianists, know about it, and as a
> result, no one ever thinks about butt fuckaling, as a type of sexaling
> enjoyment, and a sexaling past time.
>
> Explosives To Kill Hillary Clinton, Obama, George Walker Bush, Jr.
> Barbara Bush, Jr. And All The Congressmen and Congresswomen, And All
> The White House Staff, Etc.
>
> Well, I have told you about many bombs you can make, on my web site,
> and I suggest you begin to think more seriously about taking out
> Hillary's cavalcade of automobiles, next time she is riding through
> Washington DC. Or the next time you see Mr. Obama, please consider
> blowing his cavalcade of cars and limousines, up and out of the upper
> solar atmospheres, with the bombs you can make, as already explained
> about, in my notes, on this bulletin board.
>
> After you blow them up into bits, and pieces, they will be fine, as
> they will soon be coming out of my Epcot Center, as tummy babies, and
> they will be two less threats to the ordinary and normal people on
> this planet, for some time to come.
>
> A Note On Hillary Clinton, George Bush, Jr., Barbara Bush, Jr., And A
> Number Of Other Lesbianists
>
> Before you blow up Hillary, find out if she is with us, on this, or
> what. I think Mr. Obama is not with us, yet, but it may be the case
> that Hillary Clinton, along with a lot of her friends, is now on
> board, and she is hoping to set sail with the rest of us, but is not
> quite able to break away from the Lesbianists' and their organization,
> since she has been a friend with them, and a member of their
> organization for umpteen millions, billions, trillions, and zillions,
> plus years, since long before they ever even came to this planet, to
> settle it. These people, Hillary Clinton, and a number of her friends,
> are ready to make the change over, but lots of Lesbianists are not
> ready to make the change over, and so Hillary Clinton is kind of
> stuck, and so are all the other Lesbianists, who want to make the
> change over, and who want to say good bye to their former
> organization.
>
> In any case, this planet is crawling with animal people of all kinds,
> as I've mentioned, and it is a very unpleasant situation, and the
> Lesbianists know this, as most of their membership has already been
> eaten up by animal people, and there are many types of animal people.
> Many of the animal people who ate up the Lesbianists below ground, are
> walking around, as they imitate, or take on the form of human beings,
> after they eat one. Not many of the original Lesbianists are still
> alive, down below the surface of this planet, in their underground

> cities, as I've recently learned, as most all of them, close to ninety
> nine plus percent to nearly one hundred perecent of the Lesbianists
> down below the surface, have already been eaten up. There are still a
> lot of Lesbianists down below us, below the surface, but compared to
> the numbers of them who were there, before, there are fewer, now.
>
> What To Do, Now?
>
> I thought my kids were ready, with an underground system of 'safe
> harbors', but it seems there is a delay, and I'm not sure when the
> delay will be resolved. Until it is resolved, I guess we are stuck
> where we are. So, the only thing to do is to get the government to
> make the needed changes, and to step up to the microphone, and
> denounce the Lesbianists organization, by telling every one that it
> exists, and that we will now build a one world, government. When the
> politicians decide to do that, and when we begin building a one world
> government, then maybe we will begin to see some resolvement to this
> situation.
>
> I have some more ceremonies to do, and I have a lot of time to wait,
> till we see a resolvement to this situation. The additional ceremonies
> will assist us in making a safe harbor, as far as I have heard, that
> is fully integrated, and that has all the protection and safety
> systems that will be needed. All the different components to the fully
> integrated system, for covering our immense universe, all at the same
> time, are not available, yet.
>
> There is a lot to learn, about who else lives in our universe, and
> about where my kids live, and about what my kids do for me, keeping my
> universe running for me, along with a lot of other information, for
> you to get and read, and then understand, about my kids.
>
> As soon as the local, or federal governments around the world release
> the software that will allow people to upgrade to the 'Managing My
> Universe' software upgrade, from the databases, that are located in
> the underground bunkers the Lesbianists used to use when they first
> arrived, and when they were in the 'sexaling for a living' program,
> which all of them were in, when they arrived. These databases are also
> located on other planets where there are bunker systems, and where
> there are communities of people, who are in the 'sexaling for a
> living' program.
>
> Also, once the 'Managing My Universe' program software is released,
> and once people start using it, and once they set up their own
> network, that it will run on, and once enough people are running that
> software on their computers, we can have a partial soluition to the
> problem of the animal people, as well as a partial solution to dealing
> with Mormons, and Clerics, and Protestant leaders, who believe in
> "Jesus Saves" and other such useless nonsense.
>

> I think the Jesus Saves group, i.e., Christianity, the Mormons,
> Protestants, Lutherans, Catholics, Presbyterians, and so forth, is
> built on Islam, and on Judaism, or rather, on one of the schools of
> Judaism, plus maybe some other things, made up, or grafted from other
> religions that were primitive religions, such as Voodoo cults, and
> worship of the dead cults, as well as other cults, and they were all
> squished together, and the result was, "Christianity", but that was
> after all of my teachings were clipped out of the two above mentioned
> religions that I had taught.
>
> In any case, not a one of them has a clue that sexaling is a
> 'purifying' activity, and women and their sexaling bodies are like
> 'purifying' engines, or washing machines, as I've mentioned before,
> and men and their sexaling bodies, are also capable of becoming
> 'purifying' engines, and washing machines, though we all have our
> karma, and it will be a while before we erase enough of our karma, to
> make a difference, for some of us. That means, some people are better
> able to sexal than others as their karma for sexaling is better for
> sexaling than the karma for sexaling of others. We have a lot of karma
> to erase before we all begin to pick up enough steam to get any where,
> sexually speaking.
>
> I think that is the general situation, for most, but there are some
> people who are more gifted than others, and there are some people who
> are, when it comes to their sexaling capabilities, generally speaking,
> fine.
>
> With the use of aphrodesics, fruits that we can grow, that must be
> taken off the 'banned' foods lists, vegetables, nuts, and other foods
> that also are useful aphrodesics, that must also be taken off the
> banned foods lists, we will be able to make better progress. Sessame
> seeds can mold up wheat bread to make a nice aphrodesic, from what
> I've heard, and I will give it a try, one of these days, as I'm busy,
> molding up a few other things, first, sort of for experimentation, as
> this is all new to me. Peanuts supposedly, might be aphrodesic, once
> you mold up wheat bread with them. I believe they have minor pain
> killing properties, as well. Dark green garbanzo beans, sold in Indian
> food markets, also mold up wheat bread and are useful as aphrodesics.
> White bread is too poisoned to consider for use. Please use only whole
> wheat bread, or a bread of fine quality. Do not use white bread or
> normal white french bread, as the flour used in making them is treated
> with bleaching agents, that are poisonous.
>
> Compliance With The General Terms Of Their Settlement Agreements
>
> In any case, we need all the laws changed, as I've mentioned about,
> before, and we need the governments to form a united, single planetary
> government, and we need every one to begin to get the information they
> need, and the assistance they need to begin to cooperate with each
> other, in science, and in agriculture, and farming, etc. We need to

> ban pesticides, the use of petro-chemicals in the manufacturing
> industries, the promotion of natural fibers, and natural oils for
> manufacturing, and the switching over to non-polluting, hydrogen based
> technologies, and so forth.
>
> We also need the volumes of Greek literature released, as well as all
> the other literature, that needs to be released, that the initial
> settlers of this planet, were given, to use to set up their planetary
> government, with.
>
> When we start to see that these and all the other neccessary steps are
> being undertaken, in an effort to accomplish them, we will be in a
> better situation to begin to see a resolvement to this situation. The
> Lesbianists do not like to be forced into doing things, but in this
> case, there is no other way of getting these things done, and so if we
> need to force them to get them to move off their fannies, and get
> their butts in gear, than we will have to do just that.
>
> We need the Lesbianists, and all the other groups of people on this
> planet, who legally, or rather, legitimately settled this planet, but
> who are not in compliance with the terms of their settlement
> agreements, get into compliance, and the sooner they get into
> compliance, the sooner we will have a resolvement to this situation.
>
> Persons Who Wish To Participate In The Previous Sexaling For A Living
> Program
>
> I have talked about the previous sexaling for a living program, that
> people were signed up with, a long time ago, when they first settled
> this planet. I mentioned the underground bunker systems, that my kids
> still keep for eligible card carrying members. I suggested that there
> might be people who died, and after they came back from the Epcot
> Center, they no longer knew any thing about the 'sexaling for a
> living' program, that they were affiliated with, and they forgot that
> they were a valid card carrying member of the program.
>
> Even though these people, may not remember that they were once in the
> program, since they don't usually bring that information with them,
> when they are tummy babies, in mama's tummy, these people, if they
> wish to get back into the 'sexaling for a living' program, that they
> were once a participant in, they may write a statement, and state that
> they wish to get back into the 'sexaling for a living program'. They
> need to sign it, and press their energies into it, just as I
> explained, about, before. For example,
>
> Affidavit
>
> I, ____name____ would like to get back into the sexaling for a living
> program, that I was an active participant in, previously, and that I
> continue to belong to, as a valid card carrying member.

>
> Signed: (signature)
> Date: (Date)
>
> Then, press your finger, or thumb, or elbow, or toe, or nose, or lips,
> or palm into the paper you wrote, above your signature and date area,
> and make sure you press in your energies, as well as you can, and that
> should wake up my kids, and get their attention. When my kids have
> verified that your request is legitimate, they will buzz you in, or
> rather, teletransport you into the underground bunkers, that still
> exist, in many places, on this planet, and under the surface of this
> planet. These bunker systems exist on other planets, as well, and so
> every one who is qualified, no matter where they are, and no matter
> what planet they are on, can get back into the program, so long as my
> kids authorize and approve their request for entry into the program.
>
> This will get you started. You have to be certain, that you wish to
> start off, again, and that you are sincerely interested in getting
> back into this program, to sexal for a living, in accordance with the
> rules and guidelines of the original program.
>
> Once you are in the original program, now as a participating member,
> you can begin sexaling for a living, and you can also, begin to study
> about the new 'sexaling for a living' program, and the 'managing my
> universe' program, and the other programs that are now available, in
> the Gurkian Age. There are introductory courses for people who are not
> familiar with the program, and your questions will be answered in the
> seminar like introductory courses.
>
> Once you decide to join with one or more of them and once you decide
> to get into the Gurkian Age Religious Revolutionary Movement, and then
> begin sexaling for a living, as you get fit, and healthy, by your
> participation in these and other activities, as well, such as the club
> activities, as I've mentioned about, before, so that you can sexal
> more adequately, and robustly, for, eventually, days, then weeks, then
> months, then for years on end, without tiring out, too much, and in
> between sexaling activities, you will have lots of other activities,
> such as the club activities, to vary the pace of your life, to make it
> more interesting, and more engaging, by meeting with lots of people in
> the clubs, and by learning about these people, and by sexaling with
> them, once you've decided you would like to join, then you can switch
> over to the new programs, in the Gurkian Age Religious Revolutionary
> Movement, and get started when the facilities for them, are
> constructed by my engineer kids, and by others of my children, who
> will be helping them.
>
> When we have all of the facilities needed, the new programs will open,
> and you can switch over to the new programs and my kids will help you
> with the paper work to transfer over your membership to the new
> programs, in the Gurkian Age Religious Revolutionary Movement.

>
> Qualified Card Carrying Members
>
> Some of the people who I've mentioned before, such as Jodi Foster,
> Jennipher Lopez, Madonna, Angelina Jo-li, Jack Nicholson, Angelica
> Huston, many actors in the New York actors' guild, many members of the
> west coast actors guild, and many members of actors guilds around the
> world, and also, many members of dance troups, and dance guilds around
> the world, singers, musicians, entertainers, members of the military,
> members of law enforcement agencies, and so forth, many of these
> people, and others, as well, are qualified as valid card carrying
> members of the original sexaling for a living program, that the
> initial members and follow up members of the out bound programs for
> the settlers to this planet, were all a member of.
>
> Even if you do not think that you could possibly have been a member of
> one of those out bound settler's programs, you may have been one, and
> if you write an affidavit, in the form as I've mentioned above, you
> may find that in fact, you were a member of the out bound program of
> settlers to this planet, or, you may find that you were a member of
> one of the other out bound programs, to other planets, and you may
> find that you are still a qualified, card carrying member who is
> entitled to rejoin the sexaling for a living program, that you were
> once a member of.
>
> How is this possible? How can you still be a valid member, after all
> this time? Well, it is just that we need to get you started, and so
> these facilities, the underground bunker systems, that I've mentioned
> about, before, are there, and I was told by my kids, that you can make
> and sign a statement, or an affidavit, in the manner in which I
> mentioned, above, and that will be all you need to do, to get back
> into the program, you were once in. We are extending the time limit on
> the previous sexaling for a living program, as a short term measure,
> to help get things started up, again.
>
> Zealot
>
> Joining the original program, applies to all valid card carrying
> members, whether they currently know they are with an out bound
> settler's group, or not. That means, that Ms. Hillary Clinton, can get
> started up, again, as the time limit on the program has been extended,
> and so can Mr. Bill Clinton, and so can Chelsea Clinton, and so can
> all of the other people, who prefer to consider them selves as
> 'radicals', and they prefer the term, 'Zealot' as in, a person who has
> a lot of zeal for living, to the term, 'Lesbianist'. So when you see
> some one you might recognize as a possible 'Zealot' it is polite to
> use the term, 'Zealot', and not use the term, Lesbianist, as
> 'Lesbianist' has too many negative feelings attached to it, and people
> might start using it as a way to make others, angry.
>

> You do not get points, for starting fights, or for getting other
> people angry at you, for teasing them, and so forth. So, let's all
> behave, and let's all get into the program, those of you who are
> eligible, and let's go from there. If you have a friend, who might not
> be eligible for the program, you can make an application to allow the
> person into the program, and then my kids will approve it. The person
> will then get accepted into the sexaling for a living program for the
> out bound settlers.

>
> What Is Tin
>
> Tin ore is a metal ore, and it is found in cassiterite, as listed in
> many books, and it is also found in iron pegmatites.
>
> Iron pegmatites are its chief source for supply of this mineral ore.
> It is like gold, or barium, or silver, and it is found in many
> pegmatites.
>
> What is barium? It is a mineral that is found in steel ore, or iron
> ore, and it is a tough metal, and it is very strong, with great
> tensile strength.
>
> What are pegmatities?
>
> Pegamatites are large stones that contain mineral ores.
>
> A pegamatite ore stone can be found in silver deposits, and in gold

> deposits, and in many types of mineral deposits.
>
> Pegmatites are generally found with quartz, or a type of quartz, that
> is a pearly white in color.
>
> It is a cluster of ores, of various types, and the ores can be any
> thing from silver, to gold, to iron, to boron, or cadmium.
>
> What is boron?
>
> Boron is a chief component of the metal industry, and it is used for
> making steel. It is found in iron deposits, and it is also found in
> gold deposits. Boron is a chief component mineral ore found in iron
> ore deposits.
>
> What is cadmium?
>
> Cadmium is also a chief component of the metal industry, and it is
> found in large quantities, when found with silver ore, and with iron
> ore, and with gold ore, typically. It is a shiny grey ore, and it is
> very useful for making steel stronger.
>
> The processes of melting tin ore out of cassisterite, is a difficult
> process, but the Lesbianists use it to help confuse people about what
> tin is. Tin is chiefly found in metal deposits, or metal bareing
> loads, where there is much iron ore, and steel ore.
>
> Steel ore is similar to iron ore, but steel ore is stronger than iron.
>
> Iron is a little brittle, and with out the use of steel ore, and with
> out the use of other ores, to stiffen it up, iron ore is a poor choice
> for durable, pots, and durable cast iron statues as it will fragment,
> very easily, and it turns to dust, if scraped with a strong hardened
> steel knife blade.
>
> The home hobbyist, or workshop metal smith, as seen on PBS, the small
> sized smelting industry, as seen in a recent Las Vegas PBS program
> that touched on metal smithing, makes a big deal out of white metal,
> and that is iron, basically, the real brittle metal that comes in
> through the metal smith's doors from people who own statues made of
> iron. That brittle metal, if scraped with a knife, will start to
> shatter, and fall apart, and the metal smith was saying, he could not
> weld any thing to it, as it would just keep coming apart, layer after
> layer. That is iron ore, and it is different from steel ore.
>
> I suppose the Lesbianists' made up the periodic table of elements to
> help confuse scientists, and it does not jive with reality, and the
> metals animals minerals animals, elements animals, and other animals,
> that we have in our environments. The Lesbianists periodic table of
> 'elements' does not help to describe the many types of 'elements'

> animals and other animals that we find in our environments, under the
> ocean, in the forests and jungles, under the ground, or in the
> deserts, and so on.
>
> How Many Elements Animals Are There?
>
> There are so many elements animals, you will take many years to study
> about them all, if you decide to study in depth about them. Maybe it
> will take several hundreds of years, to learn about some of the things
> about them. If you wish to study about all the mineral animals, metal
> animals, elements animals, and other living animals that are in my
> many universes, it will take you a far greater amount of time to study
> about them all.
>
> We will have courses for you to study about them, once we set up our
> new civilization, and once we get around to setting up the many other
> new civilizations, that will all be patterned after our civilization,
> that we will be setting up, shortly, with the cooperation of the
> Lesbianists, the Zealots, and their many other outbound planetary
> settlement groups radical friends.
>
> New Sciences
>
> Elements animals are many types. There are thousands, and millions of
> elements animals, if not more, maybe many times more, into the
> kazillions, plus many times more, I think.
>
> Just like animals on the ground, or in the ocean, or in the fresh
> water lakes, or in the sky such as birds, or in the lagoons, or in the
> swamps, and so forth, there are untold, countable numbers of different
> animals.
>
> However, the elements animals are very far greater in number, than the
> animals we can see with our eyes.
>
> Animals of all sizes, and some of them are very tiny, exist in huge
> numbers, all throughout my universe.
>
> Tree animals, and plants animals, we learned about recently, the
> drafts babies, and the wedger mama's, they are in each and every
> plant, and they are different from every other type of plant animal.
>
> There are quite a large number or plants, and flowers, and bushes, and
> sea weeds, though we don't see sea weeds too often, or kelp plants,
> but there are lots of underwater plants, but perhaps not as many as
> above ground plants, as we have destroyed our environments, and in the
> ocean, the oceans are so polluted, not much grows in them, any more.
>
> Elements animals are very large in number. So are molds animals. Molds
> animals are very large in number, but who is there more of? I don't

> know, but maybe with all the different types of molds there are, there
> may be more molds animals, than there are elements animals, but it is
> a close call, I think.
>
> But maybe not, as there are so many types of animals in molds, maybe
> the animals found in molds, are far greater than the number of animals
> found in elements.
>
> Anyway, I suppose molds animals, if we look closely at all the
> different types of molds there are, with a microscope, will far out
> number the number of elements animals.
>
> Never the less, there are a far greater number of elements animals,
> than the Lesbianists are going to let anyone know about.
>
> Why is that? It's because they do not want to educate people about the
> real world we live in. They want to keep us dumb, and stupid, so they
> can laugh at us, or at least, as dumb and stupid to them, anyway, so
> that they can laugh at us.
>
> Well, it is a pretty unpleasant situation, here, because we have to
> learn what science is, and we have to learn the real sciences, and not
> the phoney sciences the Lesbianists teach.
>
> My memories are not good enough to even begin to teach any thing, but
> any way, we need some Lesbianists, such as George Bussey, or Clint
> Eastwood, or Morgan Freeman, and Liz Taylor, and Mila Jovovich, and
> Mrs. Barbara Bush, Jr., and Mrs. Barbara Bush, Sr., and Mr. George
> Bush, Sr., and Mr. Ronald Reagan, and Mr. George Bush, Jr., and their
> radical friends, to teach us the real sciences, along with the rest of
> the Lesbianists, or Zealots, all of them.
>
> Not a lot of them will want to comply, with that, but we can get some
> of them to comply, if you make friends with them, and then invite them
> to your houses, and sexal with them, and make them your best friends,
> and your sexaling partners. The longer you remain friends, and the
> longer you sexal with each other, the more compliant they will become
> over time.
>
> That's the best way to get the Lesbianists, or Zealots to become your
> friends and then have them teach you stuff, about molds, and science,
> that you didn't know about, before. As you learn about science, you
> will learn about making molds, using different methods, and then you
> can learn how to feed your body, and then you can learn how to feed
> all the organ animals in your body, a proper diet, and then you can
> live forever.
>
> If your organ animals all get the foods they need, you will have many
> happy animals inside of your body.
>

> Professional Moldists
>
> Lesbianists are all professional moldists, and they all have the
> capability to teach people how to mold up any thing that is worth
> molding up. They study for millions, and billions of years, and even
> longer, in some cases. They get their professional degrees, and then
> they qualify for the outbound settlers' program, and then they go off
> to settle a new planet, that has not very long ago, recongealed, after
> it was last smashed apart by a passing sun, or large planet, traveling
> at a very high rate of speed as it smashed into it, or as it smashed
> into something, such as another planet, or even a sun, nearby.
>
> That can be very catastrophic, and not many people will survive, and
> many planets in the vicinity, will shatter to pieces, when a sun or
> large planet is hit by direct impact, by a large size planet, or
> fragment of a large planet, or a sun, or fragment of a sun, traveling
> at a high velocity, near or even past the speed of light.
>
> The shock waves that go shattering out, in wave after wave, will
> destroy every planet and sun, for a long ways around.
>
> This happens, some times, and the planets and suns and moons, are
> reduced to dust particles, and after some time, they begin to
> recongeal, as they go spinning around due to magnetic waves that
> affect them. After spinning in various formations of circular
> movements, they eventually recongeal into numerous planets, and many
> different sized suns. Lots of moons also form, and you have the birth
> of a lot of new planets, that need settleing.
>
> We always send out people to settle the new planetary systems that
> need settling, who are most qualified, to establish and lead a new
> civilization, that they must construct, as a part of their agreements,
> for their being selected to settle the new planets.
>
> This is how it is typically done, and so we get the best and the
> brightest, and after their certification, they go out to settle a
> newly formed area of planets that are habitatable.
>
> We send out many groups, one after another, of highly qualified
> people. Hulk Hogan was one of those people, who came in a different
> group of people, but he is friends with the Lesbianists, and he
> supports, more or less, what the Lesbianists are doing. There are a
> lot of Hulk Hoagan's friends, who also came and settled this planet,
> in one or more of the out bound planetary settlement groups.
>
> We need Mrs. Barbara Bush, Mr. Hulk Hoagan, and all of their friends,
> including Hillary Clinton, and Mr. Obama, to get into compliance with
> the terms of their agreements, that they initially signed onto, and
> penned their names to, so that we can get further aide from my
> children.

>
> My Working Children And Where Are They?
>
> My working children take care of the support work, once the settlers
> in the out bound settlement groups are in agreement with the terms of
> compliance, of their out bound planetary settlement program.
>
> How this is done, takes some explaining, but it is fine to leave it as
> it is, for now, as it will take a lot of explaining to do, to let you
> know exactly how every thing in my universe is set up, and where all
> my kids are living.
>
> There are multiple dimensions to this universe, and I weaved together
> this universe, in such a way as to support the activities of my kids,
> and at the same time, support the activities of other groups of my
> kids, living in different dimensions, and at the same time, support
> the activities of us, living here, in this large universe of ours.
> This is the central area for us to live, and we have a different job,
> as it turns out, and that is to purify our universe that we live in,
> for eternity, so that we can all live in all the universes I have
> made. There are many universes, too small for you too see, as you are
> just too big to possibly see them.
>
> I also made many dimensions, and weaved every thing together, in such
> a way as to support the religion that I am now going to teach to you,
> over time, and that you are all going to learn about. You can decide
> for your self if you wish to practice my religion or not, but your
> practicing my religion, is essential for us to have a nice place to
> live in, for eternity. That also includes all of my kids.
>
> Different Jobs For My Different Groups Of Children
>
> We have a lot of different jobs to do, my kids, and you, and to keep
> every thing running smoothly, we must practice my religion, that I am
> now begining to wake up to and learn about, as I come out of my
> condition of amnesia, and that I am now begining to practice, in my
> apartment.
>
> This is how I planned, it, with me waking up, and coming out of my
> amnesia, and then, over time, introducing my self to all of you, as
> you all begin to practice my religion.
>
> We will be here for eternity, and it is our job to purify our
> universe, and to erase the karma, that is a continuous problem, for
> all of us. There is much we must understand about how my universe is
> built, maintained, and run or managed. All of my kids make karma, and
> to keep this universe running properly, we have to divide the karma
> up, into manageable sizes for each one of us to bare. We are in the
> best location, here in this universe that we live in, and it is our
> responsiblity, because we it is our job, to keep our universe pure by

> practicing my religion.
>
> Advantages To Living In This 'Central Bus Station Terminal Building'
> Universe
>
> There are lots of advantages to living in this universe, the 'Central
> Bus Station Terminal Building' universe, that my kids do not share
> with us, as they live and work in their many, tiny 'Bus Station
> Terminal Building Support' universes, to support what we are doing, in
> this 'main' universe. There are lots of things that you can do in this
> 'main' universe, efficiently, and effectively, that you can not do as
> well at, in the tiny universes that my kids live in.
>
> The list is long, but one thing is, taking karma, and figuring out how
> to deal with it, and then dealing with it, efficiently. Another thing
> is, balancing out karma. We need to balance out karma, to keep every
> one and every animal alive, thriving, and well, and we can effectively
> balance out karma, in this 'main' universe, better than in the tiny
> universes that my kids are living and working in.
>
> With my religion, that we will begin, soon, to accept and practice,
> some of us in our universe, and in time, more of us, and with my kids
> practicing my religion, along with us, but in their support network of
> tiny universes, and more needs to be explained about the support
> network of tiny universes and what my kids are doing, as they work in
> them for keeping things running smoothly and harmoniously, we will
> effectively have a way to balance out karma, much better than ever
> before.
>
> Practicing my religion is also good for erasing our karma, and we can
> more effectively erase our karma, and keep things running smoothly,
> for our 'main' universe, as well as for all of the many support
> universes, that my kids are living in and working in, and that we need
> integrated with our 'main' universe, to allow us all to live in this
> very big universe of ours, which includes and is central to all of the
> other many 'tiny' universes and central to all of the other living
> areas, that goes on, beyond the walls of this universe, in all
> directions for almost nearly infinity for all practical purposes, that
> I have for all of my working kids to live in and work in, supporting
> what we are doing in this universe and supporting, in an inter
> networked and inter connected manner, what they are all doing, in
> their universes, and living areas, as well.
>
> My human being kids all have jobs, and so do all my worker animals,
> and I have lots of working kids, and I have lots of worker animals of
> all different kinds.
>
> You and I, who are in this main 'Central Bus Station Terminal
> Building' universes, are the only ones who do not have jobs assigned
> to us. Therefore, we are all going to work, forever, from now on, at

> practicing my religion, and this will be our primary job, for keeping
> our universe running, and for keeping all of my kids universes and
> living areas, running in proper order, as we erase the massive amounts
> of karma that need to be erased and as we balance out the massive
> amounts of karma that need to be balanced out.
>
> This is a difficult and lengthy topic to discuss, and so I'll have to
> leave it for another day. Sorry.
>
> In any case, we all must have a job, all of my kids and I, and now, of
> course, you are all going to join my kids, whether you like the idea
> of it, or not, and begin working for me.
>
> Getting Into Compliance Of The Outbound Settlement Program
>
> Mrs. Hillary Clinton, Mrs. Barbara Bush, Jr., Mrs. Barbara Bush, Sr.,
> and all their friends are now going to have to get into compliance
> with the terms of their aggreements for the outbound settlement
> program. Once they do that, we can begin to get things started, for
> the rest of eternity, with you practicing my newest religion.
>
> This religion will take the best from each of my earlier religions,
> that I taught, and combine all of the best of them, into this one.
> There are also some other special features to this religion, and we'll
> learn them over time.
>
> In any case, we are going to place women in their rightful place,
> above men, and we are going to place men in their rightful place,
> below women. That's one of the main things that we are going to
> achieve with this new religion. It was never a big issue, before, in I
> think maybe most of my religions, if not almost all of them, where
> women stood in relation to men.
>
> Anyway, we are going to get an understanding of the fact that there
> are two races of people, and one of them is the female race, and one
> of them is the male race.
>
> That's one of the primary things, that we are going to get
> straightened out, now, with my religion, with out ever getting it
> confused, again, for the rest of eternity.
>
> In any case, we need all of the friends of Hillary Clinton, Bill
> Clinton, Chelsea Clinton, George Bush, Jr., Barbara Bush, Jr., George
> Bussey, Mila Jovovich, Bruce Willis, and of Hulk Hogan, and of all of
> the other people who came in the original outbound planetary
> settlement groups, who are still here, and still alive, and who still
> remember that they all have planetary settlement agreements to get
> into compliance with.
>
> Unless they do that, there is not much we can do, except wait around

> until they finally do decide to get into compliance. They must then
> take the neccessary steps to inform every one, about the facts of this
> situation.
>
> The Planetary Government And The Laws For The Citizens Of This Planet
>
> Until they do that, we can not get much work done, as all the laws,
> and the way the societies on this planet are set up, will not work for
> us. Nudity and nakedness must be permitted, and so must public
> sexaling. All forbiddance laws must be dropped, and all laws on
> behavior, and the types of plants people can eat, and so forth, must
> be all dropped.
>
> The sets of laws that are the basis of the outbound planetary
> settlement programs must be then instituted. The governments that the
> Lesbianists have set up, must be dropped, and one planetary government
> must be formed with those laws as the foundation for all of the
> citizens of the planet.
>
> Those are the first steps that we must take. After that, we will get
> and have the needed arrangements, to set up my religion, globally, so
> as to make it accessable to every one.
>
> We are also waiting on the release of the software and operating
> system, that I released to the FBI, through their twenty four hour a
> day, audio and video surveilance of me, which I've talked about,
> before. When that software and the operating system are released, we
> can begin the 'managing my universe' program, and the 'sexaling for a
> living' programs, that will then be instituted, after the Lesbianists
> and their friends, get into compliance with the terms of their
> agreements.
>
> Once they get into compliance, and once we get the software from the
> tapes of the video surveilance, we will be able to institute the
> 'managing my universe' program, and the 'sexaling for a living'
> programs.
>
> Until then, there is not any hope for any meaningful change. So, until
> then, please make friends with the Zealots, or Lesbianists, and their
> friends, and become good sexaling partners with them, and get them to
> teach you more about the real sciences, and about molding sciences,
> etc., and make good relations with each other. It may take some time
> to get their attention, and to get them to begin to accept your offers
> and invitations to your homes, or to their homes, on occaision, for
> sexaling sessions. After sexaling for several weeks, non stop, they
> will all become more pliable, and more compliant, and they will begin
> to loosen up, and then open up and talk about things, as you all begin
> to learn to trust each other, and to treat each other with care,
> consideration, and respect. You can then begin to build on your
> understanding of each other, and your relationships with each other,

> will begin to blossom.
>
> Sexaling Professionals
>
> The Zealots, and their friends are professional sexalers, so they can
> teach you many things and secrets about sexaling, that you may not
> know about. You will make good bed partners, and after some time, you
> can learn lots of things. There are cures for herpes, of course, and
> for genital warts, and for all venereal diseases, and so forth. These
> Zealots, the Lesbianists, know all about them, as they had to study
> all of that stuff, to get qualified and certified for the outbound
> planetary settlement programs. You will also be able to learn proper
> diet techniques so as to be able to feed your body, and all the organ
> animals, and other animals, that are living in your body, and that you
> need to feed. You can also learn proper skin care, health care, and
> body hygene.
>
> Wedding Arrangements
>
> Currently, the way things are set up, with one person, a male, and the
> other person, a female, getting licensed to marry each other, will not
> work, under the new system. Thus it is neccessary to get into
> compliance with the terms of the outbound planetary settlement
> programs, so that the new laws will allow for multi person marriages.
> Multi person marriages, I discussed, before. Women and girls need
> multiple men and boys to sexal with, properly, as women and girls are
> very capable sexalers, once they learn how to sexal properly. Multiple
> person marriages will allow for mulitiple women and girls, and
> multiple men and boys, to marry each other. The current laws must be
> dropped, and the current governments must be disbanded. After that,
> the new government and the new laws will allow for multiple person
> marriages. Once multiple person marriages are allowed, after the new
> government is set up, then the sexaling for a living programs, will be
> instituted, as a part of the compliance terms.
>
> Informing The People Of This Planet About The Terms Of Compliance
>
> The Lesbianists need to inform every one about what the terms of
> compliance are, and they had better get to that, soon. They must then,
> with their many friends, who came after them, or along with some of
> them, as they arrrived on this planet, by space carrier, or space
> ship, begin to get their Lesbianists friends in all the governments of
> the world, and their other friends in the governments of the world, to
> comply and participate in setting up the one world planetary
> government.
>
> The software and operating system software, have in them, access
> capabilities to access data bases, to down load all of the
> information, that is needed for every one to learn about and to begin
> participating in all the new programs.

>
> Building The Infrastructure, And The Needed Facilities, Etc.
>
> Once you begin accessing the databases, and once you begin to study,
> and learn about the new programs, my kids, who work in other
> universes, and in other dimensions, will then begin to build and set
> up the infrastructure, housing, food production facilities, medicine
> production facilities, recreational facilities, academic facilities,
> hospital facilities, prison facilities, and so forth, that will be
> needed to further advance the programs every one will be required to
> begin and will need to begin to participate in.
>
> Once we get to that point, we will begin to be able to have a stable
> society, with all of the new technologies that will be provided for
> security, and personal safety.
>
> Molding Up Bread And Metals Animals, Etc.
>
> I said, before, that you need only a square inch or so of metal in
> each one gallon of bread you are molding up. That may be a minimum,
> but it is better to use more. If you are using a plastic container,
> you can line the bottom of it, with aluminum foil, and you can line
> the in side walls of the container, up to one half to two thirds up
> towards the top, for better results.
>
> Some molds animals like silicas. Some like quartz. Some molds animals
> like tourquoise. And lots of them, like various mixtures of minerals
> and metals, and elements animals, as well as other animals, we do not
> know much if any thing about, who are hiding inside of rocks, and
> stones. Anyway, we'll find out, in time, all about what molds animals
> we are trying to make, and what they like to eat, and then we will
> find the right types of rocks, ore rocks, mineral rocks, and other
> types of rocks and stones, and we will provide them to the molds
> animals, and funguses animals, so that they can get fed well. The more
> well fed we feed them, with all of the many types of worker animals of
> mine, the healthier they the molds animals and funguses worker animals
> of mine will become. The more healthier they become, as we raise them,
> in the containers we find to farm them in, when we are finished
> farming them, and then when we eat them, the more healthier the organ
> animals in us, will become.
>
> The more healthier the organ animals in us become, the better able
> they will be to make babies, and the more successful we will be at
> prolonging our longevity. Our bodies are meant to last for eternity,
> if we feed them with the right worker animals of mine, and all the
> proper foods and nutrients they need to stay healthy. We have much to
> learn about all of this, and the sooner you begin making friends and
> making sexaling partners with the Lesbianists, and their radical
> friends, the sooner you will be able to begin to understand how to
> feed your bodies, properly, so that you can begin to live forever, and

> so that you can begin thinking about working for me, in this main,
> Central Bus Station Terminal Building that we are living in.
>
> What Will Be Your Main Jobs From Now On?
>
> It might take you awhile to decide to begin working for me, but the
> sooner you decide, the better off we will all be, as we need all of
> the wonderful sexaling energies you and your sexaling partners will be
> helping to create, to fill up this universe of ours, and to fill up
> all the many universes of my kids, and all the living areas of my kids
> who live outside this 'Central' universe we are in, which is a very
> big place, as I've mentioned about, before. It is very hard to fill up
> this 'Central' universe we are living in, with all of the wonderful
> sexaling energies, that will allow us to begin to breath, easier, once
> again, and that we are starving for, and that we are currently
> depleted of.
>
> We will, though, over time, fill up this whole universe, and all of
> the many other universes, and areas my working kids live in, with all
> the needed sexaling energies animals, and other types of energies
> animals, we do not understand too much about, and that we also have to
> study about, one day.
>
> My working kids are all doing their best, sexaling for a living, so
> that they can erase their karma, and balance out their karma, in
> addition to working at their main support jobs.
>
> Those of us, you and I, in this main, 'Central Bus Station Terminal
> Building' do not have any support jobs, so we will have lots of time,
> for the 'managing my universe' programs, and for the 'sexaling for a
> living' programs so that we can also erase our karma, and balance out
> our karma, as well as erase all of the karma of my worker animals, and
> also, help balance out all the karma of all of the worker animals of
> mine.
>
> That is your main 'job', from now on, sexaling for a living, as well
> as working in the 'managing my universes' programs.
>
> We will have lots of time to study about every thing we need to and
> want to study about, so we can better understand the many things we
> need to learn more about, so that we can appreciate what my working
> kids are doing, to keep all of the many tiny universes, and all of the
> living areas, as well as our universe, in proper working order so that
> you can all live and work forever, as one big family of children.
>
> There is much more to learn about, with regards to my family of
> children, and about all the new human being kids we will be greeting,
> and welcoming into our large family, as the ladies and girls begin to
> bring them into our 'Central' universe, as tummy mommies, along with
> the tummy daddies, and we will learn more about the many new working

> kids of mine, that my working tummy mommies kids and working tummy
> daddies kids, will be bringing into, and welcomeing and greeting as
> they come into each of their universes and living areas, another day.
> We will also be seeing many new worker animals of mine, over time, as
> many, many new ones, of all types, will also be joining the working
> force of my worker animals.
>
> Getting Busy, Cleaning Up, In The Gurkian Age
>
> It will take us a long time to get every thing into good order, and to
> clean up our universe, and erase our karma, and balance out our karma,
> along with my worker human being children, who are all busy, cleaning
> up the many support universes that they live in, and cleansing their
> karmic records, etc., and who are all busy, cleaning up the many
> support living areas, that they live in, and cleansing their karmic
> records, etc., as they begin to practice, more and more, my new
> religion for the Gurkian Age that we are now in and at the begining
> of.
>
> This may sound hard to believe, or 'fictious', but it is not
> 'fictious', and over time, you will learn all about every thing in
> detail, and you will begin to get your selves grounded in reality,
> more and more, as you begin to work in the 'managing my universe'
> programs, and as you begin to work in the 'sexaling for a living'
> programs.
>
> Taking The First Steps Towards Resolving Cooperation Issues
>
> Making friends and becomeing sexaling partners with the Lesbianists,
> the Zealots, and with their radical friends, is your first step in the
> correct direction towards resolving the difficulties we are
> encountering, now, to some extent, because of the Lesbianists, and
> their radical friends reluctance to cooperate. The more friends you
> make and the more sexaling partners you make, the more the Lesbianists
> and their radical friends will begin to 'cooperate' with you, in all
> the ways that are important to resolve the cooperation issues, and non
> cooperation issues, that are currently in need of resolving.
>
> Air Raid Shelters And Play Time 'Fetish' Sexaling Underground Dungeons
>
> People with underground air raid shelters, may wish to add on to them,
> and expand their size to accomodate all the new friends from among the
> Lesbianists, or Zealots, and their radical friends, who people with
> underground air raid shelters, or other convenient places,
> underground, such as play land dungeons, which some people who like
> fetish sexaling, may have, will be inviting in to their underground
> air raid shelters, for a long duration stay to have the Lesbianists,
> or Zealots, and their radical friends, teach them about sexaling, and
> teach them about molding, and the sciences that these people know
> nearly every thing about. Almost one hundred percent of the course

> work had to be completed, and in many cases, it was one hundred
> percent of the course work that needed to be completed, to make them
> an eligible candidate for an out bound planetary settlement program.
>
> Becoming Trusting And Loving Friends With Each Other
>
> As you invite these people into your homes, you will need proper
> accomodations, such as extra rooms, and extra beds, and so forth, so
> people with underground air raid shelters, and with underground fetish
> sexaling rooms, or dungeons, will need to expand the size of these
> underground rooms, so as to accomodate all of the guests they will be
> inviting in, to meet and sexal with the family, the relatives, the
> neighbors, and other trustable persons.
>
> You can learn many secrets about sexaling, and you can learn a lot
> more, than you would imagine, as all of these people were certified as
> instructors for teaching sexaling techniques, judo and ai kido
> techniques, as well as impromptu ninja type, assasin techniques, for
> use in a pinch, to protect their lives. They were also certified to
> teach molding sciences, and all the earth sciences, and planetary
> science, all the math sciences, and so forth. They were also trained
> in government sciences, nutritional sciences, medical sciences, and so
> forth, so they could be all around, professional, well trained
> persons. All this training was for the bright of the brightest, and
> they spent many hundreds of thousands, and millions of years, and
> billions of years, and some times, more, training and getting
> certified in all the career sciences, as well as in fitness and health
> sciences, that they needed to learn to set up a new civilization, with
> a fully developed government, in accordance with the instructions and
> requirements for that government, which was to be based on the same
> pattern of government, where they trained to become certified
> officials on the planet they were to settle, and in the galaxy they
> were going into.
>
> They were trained to be excellent leaders, and capable people, in
> every sense of the word, to get and hold the attention of all late
> comers, and to prevent the late comers from attempting to dislodge
> them, from government, over some petty, dissatisfaction, about their
> performance. Their performance issues were of major concern, so they
> were highly over qualified, so as to make it clear to all late
> commers, people who would be arriveing later, either as new additions
> to the population, on the out bound planetary expeditionary settlement
> program, or as tummy babies, to tummy mommies, and to tummy daddies,
> who they all new they were going to become.
>
> They are so well trained, they can teach you practically any thing,
> not only with regards to medicine, government, the sexaling sciences,
> and so forth, but even about the martial arts sciences, and ninja
> sciences, and the techniques they learned, which they practiced, many
> of them, diligently. They can do some very fancy martial arts and

> ninja assasin tricks, if you ask them to, and they can be very
> entertaining as some of them are very adept, or skilled at performing
> these tricks, and secret martial arts attack and destroy skills. As a
> rule, in the Lesbianists organization, any way, they are only allowed
> to use those skills, in a life or death situation, so you should treat
> them, well, and be courteous, considerate, and kind to them, and make
> sure their stay is comfortable, and that they are well fed, and
> offered only the best foods, and the best wines, etc. They will help
> you to learn how to make good tasting wines, which are not only good
> tasting, but also, good for you, which will help feed all the animals
> in your bodies, including the organ animals, so that you can
> regenerate and rejuvenate your bodies.
>
> Of course, when they were in training, for the out bound planetary
> expeditionary settlement program, when they trained in the martial
> arts, and when they trained in the ninja sciences, they were
> certified, and got their diplomas, as well. In the guidelines, they
> are not allowed to use their ninja attack and destroy skills, or their
> death threat level, response and offense to attack and destroy an
> enemy, who might like to dislodge them, forcefully from government,
> and perhaps kill them, if they could, to get them out of the way,
> permanently, unless their lives are in danger.
>
> So long as you do not threaten them, and make hostile remarks to them,
> and so long as you remain courteous, careing, considerate, and kind to
> them, and so long as the men and boys act in gentlemenly manners, and
> so long as the women and girls act with lady like, polite manners, to
> whom ever your guests are, you will certainly be able to get along
> with each other, without any problems, at all.
>
> They were trained in the sexaling sciences, and in the molding
> sciences, and in all the academic sciences, so that they could also
> offer educational programs to all of the new comers, whether tummy
> babies, and off spring, the children of the members of the out bound
> planetary expedtionary settlement program, or whether new members,
> incoming from else where, who would like the additional academic

In fact this is how a lot of early 'live chassis' 405 line TVs worked,
except that they used a resistor in place of a light bulb.

Yuck!!

No voltage regulation at all, let alone the electric shock risk.

If you did connect a sulfated battery to this, the battery could easily drop 60V at normal charging current and it would get extremely hot, extremely fast. I would not like to be near something full of hot sulfuric acid and hydrogen and probably also a source of ignition in due course.

A modified PC power supply would be just as cheap and far safer.

Yes, they had some at Lidl a couple of months ago that were VERY cheap and
had regulated charging voltage, and looked like pretty good chargers.

I picked up a couple of inverter powered microwave ovens at the goodwill and
I was wondering if these power suppies can be used wih tube amps and such.
Also would like schematic data if I could so I could see if I can modify
them for other voltages besides thosed they are designed.

I didn't know such contraptions existed ;) Please post brand name, model
and nameplate information from them to permit a bit of research. Sounds
like a candidate for the quad 807 linear awaiting a power supply...

Cant get to them right now for more data but one is a Sharp and the other a
Panasonic.

1939. Smokey 807

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-25 04:53:31 UTC
From: Jack Schmidling <arf@mc.net>
Message-ID: <13adlqkifmjg6f9@corp.supernews.com>
Source record: 7030

A friend gave me two 807's for my exciter project. The first one I tried turned into an 866 and just glowed blue and had a mini lightning show inside.

The second one looks like it has a coating of soot on the inside or at least a smoky glass sort of look. It is so neat and evenly distributed that it is possible that it was made that way on purpose. I have never seen another tube that looked like that and no one I have asked has either.

So, the question is: could this be intentional or is it indicative of a tube problem?

I can only seem to get about 10 watts out with about 30 input and wonder if there could be some connection.

I just ordered a NOS from Antique Radio but thought I would ask anyway.

Pics of this project are at http://schmidling.com/radio.com

Thanks,

js

1941. Tube Power Oscillator not working properly

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-25 13:21:00 UTC
From: peterpion@yahoo.com
Message-ID: <1185369660.545823.196480@o61g2000hsh.googlegroups.com>
Source record: 7032

Hi,

I am trying to build a tube power oscillator running at 25MHz from a Russian tube (GI6B), and although I have it running, I can't seem to ramp up the power to anywhere near the level I want out of it. I am aiming for 200 to 400 watts, but I seem to be running at just a handful of watts. Everything I have tried that I assumed would control this parameter seems to have failed to work...

The RF is needed not to transmit but to drive a plasma, but for now I just want to get the tank coil running the right voltage level. But with a B+ of about 1000V, I am only getting about 50 volts in the tank coil.

Circuit diagram is available here http://geocities.com/peterpion/oscillator.jpg

Parameters are:
Voltage = 1000V, full wave rectified and smoothed
Tank coil, 5mm copper tube, 7 turns, 5cm diameter, 7cm long, 1.3uH
Tank Cap, air dielectric, 5mm spacing, 13cm square, 31pF, 1.6mm thick copper plates
Tank circuit is capable of taking at least 100A, very heavily soldered
Feedback coil, 5 turns 2mm copper wire, same diameter as tank coil, 5 cm length, placed on same former with gap of 3cm between tank and feedback coil.
B+ choke 120 turns on 32mm diameter former
Bias, external 12V supply, fed via a diode to the ground side of the grid coil, with a 33k resistor going to ground from the same point, bypassed by a 1nF cap.

Although I have it running, both increasing or decreasing the feedback turns reduces the tank voltage.

The tube spec is 350W anode dissipation, mu of 18-26, 2.5KV max, but with heavy grid current requirements it seems, although I am not quite clear on this.

http://www.nd2x.net/gi6b.html

Ive never built anything like this before, and I am lost as to where I am going wrong. Is it that the tube has too little gain to drive itself up to those power levels? I assumed that the low gain would just mean that I had to couple more power back to the grid to make it work. But if I increase the turns on the feedback winding, it actually reduces the power - as does reducing the turns. 5 seems to be optimum.

I have taken care to keep all leads short - very short (1 to 3 inches mostly). Rats nest construction. Have tried several types of caps, all apparently rated for heavy RF use. Even rolled my own caps from copper sheet and polyethelene which work the same as the other caps.

On the scope, I can see that I never drive the grid into positive. This seems wrong to me, but nothing I do makes it go positive. On the plate, all I see on the scope is a tiny 50v drop (at 25MHz) when the tube is supposedly hard on, ie the tube at the most on condition through the cycle, still has about 950V across it. So I assume that I am not turning the grid on enough.

I am wondering if the problem is gain, IE is there too little gain to make it work properly? Do I need to add another tube in a darlington type of arrangement to add enough gain to make it work better?

I want this type of free running oscillator because it should stay in tune as I add small amounts of reactive load (the plasma during warm up etc) - or at least thats what I believe, not being an RF guru I am not certain of this.

If anyone can help me I would appreciate it very much. Having spent the last 2 weeks trying, and read everything I can and searched the web extensivley, I am at a bit of a loss as to what to do next.

I do apologise for probably stupid mistakes / questions (you cant do that! you need a driver stage...? who knows!) but I am sure someone must have done this before so I appeal to them to share their experience!

Thanks, Pete

The first tube is obviously seriously gassy. Black
coating were applied to some tubes but I don't remember
seeing it on 807's, just some receiver tubes. It might also
be a deposit of something from the filiment/heater. Do you
have a tube tester? Many will test 807's. Low power output
may be due to low filiment emmission the tester will tell
you.

I think the fact that you do not have a load on the output tank, is what is limiting the >power< output. Power tubes require a particular load Z to deliver 'rated' power. Right now all I see is a parallel LC tank which will be high Z. You quote a voltage of 50V "in the tank coil". How are you measuring this?
Can you monitor plate current? If so, that times the applied plate voltage will give you your DC input power. Power out will >always< be less than this amount.
Also, are you sure your HV supply has the current capacity for the 200-400W you want to get out? (This may mean something like 300-600W, or more, DC input power).
Are you taking steps to prevent radiation of the generated RF into the wider environment? The level of power you are talking can reek havoc with other licensed users. The FCC could pay you a visit.
Finally, BE CAREFUL! These DC voltages can kill, and you have not lived until you have gotten an RF burn from 100W, much less 300-400W.

Hi Bob thanks for the attention,

Re the load, I am using a soft iron 'poker' which I bring close to / into the tank coil to provide a load which I can easily tell when power is delivered into. So I fire the circuit up with the scope connected to a certain point, then increase the load by bringing the poker closer to or into the coil. The iron looks like a very close to resistance load, the Z varies with the proximity. So I cat test all loads from high Z to a few ohms. If the iron gets hot, I am delivering a decent amount of power - got some decent power with a circuit like this running at 7 MHz with the iron getting very hot.

While doing this I monitor the voltage on the plate or tank coil with a scope. So the 50V is the best peak to peak voltage across the tank coil.

Loading the circuit more reduces the pp voltage in the tank. And since the tank Z is about 200R, p=e(squared)/r so p=1.6 watts in the tank circuit.

Plate current is around 100mA but this is mostly dumped into the anode as heat.

PSU is half amp MOT plus variac, bridge rectifier and 10uF cap. Shunts are removed from MOT. Plenty of power available, about 1kW.

As for shielding, when running at full power the whole thing will be screened including the load. Till then though, the tops off although I dont think that much will radiate from the exposed leads even when the power gets up to decent levels.

As for RF burns, yes I am rather nervous about that too... I am used to working around up to about 20kv but this RF angle is a new thing, so I am being cautious. Painful experience is the best way to learn your lesson and I have had it :-(

Anyway thanks for the suggestions.

Where are you getting the "200R" value from? (And what is 'R'?)
Another thought is to change the L/C ratio which should give a different
loaded Q with a given poker position. This may provide more power out.

200R is British for 200 ohms.

(which does seem a bit low for a proper match, for 1kv plate voltage and
~300w RF out shouldn't the tank Z be closer to 3,000 ohms?)

(or is my sleep deprivation showing?)

With only 1KV on the anode you are unlikely to get more than 40W out.
You need to be nearer to 2.5KV with a lot of cooling to get anywhere
near 400W. Good layout is vital with this tube, they are good to 3GHz
and will take off without some sort of stopper in the anode cct.

Also... borrow a GHz Spectrum Analyser and chech that the unit is
running at the expected freq. What bandwidth is your scope ?

An anode APC is also a very good idea. A few turn of 16AWG around a 2W
4R7 maybe a good start.

Any chance of cranking Va up to 1500V just to see how much power
increases ?

Don't forget a fresh change of underwear and a fire extiguisher :)

Regards,

Mark

Source record: 7042

Well im not completley certain - heres some of my maths.

Far as I have read, for Class C operations,

Load Z should = Plate voltage/2 * Plate current

And since I am aiming for plate current of 300mA or so (for power of
300 watts at 1kV) then thats

1000/2*0.3 = about 1500 ohms (R).

Then tank Z should = load Z / Q

For a Q of 7.5, which is slightly below average I think, thats
1500/7.5 which is 200R tank Z.

Then via Xl = 2piFL, Xl is 2 * 3.14 * 25M * 1.3u which = 204R
and
via Xc = 1/2piFC, Xc is 1 / (2 * 3.14 * 25M * 30p) which = 212R

So the tuned circuit is going to buzz at a slightly higher F than
25MHz but only slightly, at a Z of about 208R. I think stray values
are larger than the difference here so this is not worth worrying
about.

Thats my understanding of the maths having studied it over the last
few weeks and I am pretty sure its in the right ballpark, although the
Z could be a bit high or a bit low for the tube conditions. But since
the thing buzzes at 25MHz the F is right, and if the Z is a bit off
this just means the Q is a bit off and I understand this is not a
critical parameter for power.

Also to back this up, the tank Z and tank coil and tank cap values are
about the same as you see in published designs for this tube (GI6B),
this power level, and this frequency (eg http://www.nd2x.net/yu1aw/1xgi7-6m-schem.GIF
- its a GI7B but apparently they are almost identical). Ive compared
with a few circuits for these tubes and they are all similar.

Only thing of course is that they all use grounded grid, which is not
anything like the grounded cathode I am using.

Of course if I have my tank Z wrong, this would surely cause power
problems. But as I say, I cant see anything wrong with these values,
but maybe thats my lack of knowledge...

Thanks for the help so far...

Thats interesting - whats a stopper in the anode circuit? The
combination of a resistor and an inductor? And if the tube does take
off at 3GHz, will I get fried by the microwaves??!

Regarding good layout, what should I be watching out for? Is this just
a matter of short leads, or do things like the position of the tank
coil relative to the tube matter?

Re voltage, I have cranked this up to 2.2kV (its on a variac) with no
extra joy - the tube gets very hot very quick (of course) but the tank
circuit dosent get any more voltage across it.

GHZ spectrum analyser would be a nice bit of kit to borrow, but I dont know anyone with one - which is a pity. The scope is 40MHz so 25MHz is pretty close to its max and the resolution is not the best. Waveform is fairly symmetrical so I think the fundemental is right at 25MHz.

Ill do the APC tonight, what difference will it make?

As for 1.5kV - yup, I have had it cranked to full, 2.2kV, and no extra power really (maybe a slight amount, but I am looking for 1kv swing where I am only seeing 50v so its not even close). Underwear got messy... makes the hair on the back of my neck stand up from fear to be that close to a 10u cap charged to 2.2kv...!

The APC is intended to be resistive (damps Q) at high freq and very
low reactance at operation freq. I should have mentioned that the 4R7
should be a carbon resistor (not wire wound).

I hope that the anode isolation inductor is mounted away, so can't
form part of the tuned circuit... What value is the inductor you are
using ?

Just for getting the anode tuning sorted out, have you considered
driving the grid with a crystal oscillator source and a suitable
buffer - this splits the problem in two. A few volts of drive should
be a good start, maybe a CMOS oscillator driving some paralleled
74AC04 buffers, that will give you 5V P-P drive into a 1:2 torridal
transformer, 10V P-P may be useful dive ?

Just out of interest, why haven't you gone for Grounded Grid
configuration ?

VHF oscillations will develop extremely high RF voltages since the
tank coil will look like a high impedance RFC and there will be
no load. Expect to see a lot of arcing.

I was kinda wondering if maybe there wasn't some humongous GHz
oscillation that's taking up all the power, leaving none for HF. As you
point out the best way to check this would be with a spectrum analyzer,
although without it you could maybe slowly increase the plate voltage
and look for odd jumps in grid current or dives in plate current.

I looked at the data sheet and saw two grids -- is this a 'normal'
tetrode? It appeared that they were calling out negative voltages on
grid 2, which confuses me.

I noticed that you do not mention any sort of shielding or shielded room for this plasma driver. Given that situation, it would probably not be in the best interest of this group to help you build a high power oscillator with limited frequency stability and the possibility of gross amounts of RF escaping into the ether to interfere with other licensed and unlicensed users of radio spectrum, including ham radio operators.

Having said that...there were Radio Diathermy devices made in the 1930s & 1940s era that were simply free running power oscillators, much like what you are talking about. These old-design devices are now illegal to operate in most countries. Similar designs are still used for welding plastic assemblies, but these are required to operate inside a shielded enclosure or in a totally shielded room.

To make something like this you would probably want to start with a conventional VFO (Variable Frequency Oscillator) of the Hartley type, then scale it up to run at the power level you want. However, in order to not run afoul of the law, you might want to build a very stable crystal controlled oscillator and driver section that would then drive your power amplifier. There are specific frequencies that are allocated for use by "incidental radiators" that are part of industrial equipment. Check with your country's radio spectrum regulating authority to find out what the legal operating parameters are for your country & locality.

Anode choke is about 1.3mH, but its not mounted away, its pretty close, about 2 inches, although its in the opposite plane to the tank coil. Is that OK?

As for driving with a fixed generator first, it would be a good thing to try I must admit - but its a big effort. I have no geny that will go to 25MHz and to make one capable of providing the 20 watts or so I would need would put me considerably back - I know shooting straight for the goal in a case like this is harder of course, but seeing as I have the thing running already at low power, I am hoping still...

As for the 'two grids' this seems to be bad documenting (the original russian docs I think). There is definatly one grid - the tube has a single grid between a pair of connections for the heater, one of which is commoned with the cathode, and also a plate connection of course (the heatsink). The docs showing 2 grids confused me but I assume that its just that they couldent be bothered to redraw the picture! As I say, theres simply not enough connections... Unless theres something I dont know about here?

Re is it buzzing at UHF and I simply cant see it I did wonder that too. But I guessed that there would probably be signs, like more heat in certain caps, and corona and such. But I cant discount it. I guess I could test this with a filament lamp indicator or similar.

And as for ARVs concerns, quite right to inquire. The test design is currently as screened as is practical, mostly boxed in an aluminium box, but the base is off, which is where the grid circuitry is. I think that at this level, there is negligable radiation from this side of the circuit, but at the desired power, maybe there would be some. However the base will be on as soon as I have it working properly, as much for the sensitive electronics I have in the workshop as for reduction of spurious emissions. The several computers I have have demonstrated their sensitivity to RF at a low power level by all deciding to wipe their hard disks when I used a new HF striking TIG welder a while ago - a sad incident as I am sure anyone who has gone through the same thing will agree.

When in final use, the output will be capacitvley coupled to a quartz glass tube that passes through the aluminium case. Gasses at low pressure will pass through this, be excited by the discharge and will glow, and this glow is viewed through a wire mesh screen for spectrographic uses.

I may need to add a second outer case depending - I am unsure yet whether induced currents in the case will reradiate a significant

amount of RF or not, so we will have to wait and see.

As you say, one option would be to fix the frequency and then tune with a cap - the main reason I dident shoot straight for that is that in the UK you cant radiate anything at all, so irrespective of my chosen frequency, I have to screen to a high degree of attenuation. And now that I am begining to think that I need to include a variable cap to tune the grid circuit to the tank (this is my latest hypothesis why I am not getting the power I need), there seems to be no disadvantage to fixing the frequency. So we will see.

Could anyone comment on that idea by the way? That perhaps, the capacitance between the grid and plate or cathode is resonating with the feedback coil, but is tuned to a different frequency to the main tank, and so limiting my drive? I did wonder about changing the Q of the tank to make the amp more broadband, which I think would reduce the impact of such a difference in frequency. Also I could try adding a tuning cap to the grid coil to tune it to the tank coil maybe.

This might make a good contest: coming up with an SSB transceiver that is capable of making real contacts on the air with a minimum number of tubes. The IF and Xtal filter could be make bilateral for RX and TX, and maybe using diode mixers (for the PD and TX mixer) might also allow some bilateral shared stages in those areas as well. Even the TX predriver could be switched for the RX RFA with some effort. I wonder how few tubes it would take to make a 5-watt QRP xcvr for 20 meters? The receiver doesn't have to be overly complex. A basic direct conversion receiver could serve as the entire IF and detector, with the xtal filter in front for single signal reception.

i have found that they are regulated and variable to some degree via pwm Old
stle microwaves varied power by varying the duty cycle that the tube was on
over a period of seconds. that is to say if a 705 power was set the tube
would be on full power for 7 seconds out of 10. the inverter style actually
decreases the voltage to the tube. interesting possibilites about for
amplifiers

Why not re-work a 10 Meter(CB) SSB), Re-Tune the Rx. Front-end for 20 Meters, Use the 10 meter Tx as an Exciter to drive a 20 Meter Final.

This way 85% of the design work has already been done and tested !

Are you out to prove a point, or want a working rig ?? Tubes have been obsolete for fifty years !! Why else would you attempt to build a Sideband rig using parts that have been out of production for several generations. If you are going to wind coils and Rf transformers why not wind them for transistor stages. Transistor Rigs (CB) are CHEAP. Tube type rigs have long been relegated to the Scrap Heap.

What's wrong with building a tube radio?? Tubes are actually more
available now then they were twenty years ago. There are thousands
of tube rigs still in daily use. There are several companies that
deal exclusively in vintage electronics. It's a hobby, and if someone
enjoys vintage technologies, so be it. I enjoy the best of both worlds.

BTW, have you priced a Hallicrafter SX-88 or 115 lately? A decent
Collins R390?? Heck, many transistors are becoming just as obsolete.
State of the art is DSP and software defined radios these days.

The ARRL published a series of small books on SSB(receivers,
transmitters,
xcvrs, amps, and theory) between the 50's and the 70's. I have two of the
series that I use as reference material. One of the articles was a 3-tube
transmitter for 20M. There are several other interesting projects that might
fit your
requirements.
One additional pointer... the Bill Orr Radio Handbook (exact edition
unknown,
but the cover was bright red!) had a monoband transceiver project that was a
very
neat, simple, and well designed transceiver. It had many features in common
with
the Swan transceivers of the 60's and 70's....
Wish I could be of more exact help, but I've passed on most of the older
books
to make room for antenna tubing in the shop.
Good luck with your projects.

Mind Control and Directed Energy Weapons

Do you know Mind Control Weapons and Brain Washing (such as CIA Mind Control Project : MKULTRA) ? Do you know voice can be transmitted to human's head from long distance(V2K)? (In 2002, the Air Force Research Laboratory patented precisely such a technology: using microwaves to send words into someone's head.)Do you know Directed Energy Weapons(such as: Electromagnetic weapons) and Non-lethal Weapons? Do you know that people's thoughts can be read now? Do you know Nano technology weapons (such as British MI5 Nano technology spy weapons which can control little spy mice from long distance)?

Such kinds of weapons have already been used covertly to torture and harass innocent, legal, unarmed and defenseless civilians for many years all over the world.

There are more than 1500 people who are suffering terribly from mind control and electromagnetic weapons torturing and harassment. Some victims were only 21-22 years old when the first time they were seriously tortured and harassed.

Have you ever imagined that there even was not one happy and peace day in the life, but only suffering for 5,10 or 20 years? Yes! Some victims died, but at the last minutes in their lives, the only thing belongs to them was still suffering.

Please come to help us by signing your support to stop these kinds of weapons torturing and harassing lawful citizens. Our goals:

(1) We wish a resolution from United Nations to stop Mind Control and Directed Energy weapons torturing and harassing. (2) We wish all government cooperate together to sentence those torturers according to law.

More Information, please come to http://soleilmavis.googlepages.com

Does anyone have experience and/or recommendations
for analogue and digital I/O interfaces based on the Universal
Serial Bus (USB)?

Just an idea for the genesis of a homebrew spectrum analyser.

Somebody already suggested the "Imp" that was in one of the later ARRL
SSB manuals (and the same author came up with a solid state version later),
and presumably had appeared in QST before that.

A different way of dual use, without the bilateral stages, is to have
a balanced mixer, the filter, IF strip, and then a balanced mixer. By
using broadband mixers, the first stage is either the receiver mixer,
or the balanced modulator for the transmitter. Then the balanced mixer
at the output of the IF stage is the product detector on receive, and
the conversion mixer on the transmit. The signals all go down the
strip in the same direction, and relatively little switching is needed.

One of those ARRL SSB manuals had such a transceiver, nice and small,
albeit with transistors.

Though, I seem to recall there was a transceiver made out of subminiature tubes in the late fifties or early sixties. Unless I'm confusing it with something else, it was in the Bill Orr Handbook.

>
THat's a bit of a stretch, fifty years ago transistors were hardly capable
of replacing tubes. Yes, there was solid state equipment coming off
the line by 1957, but much of it wasn't particularly great, designers
not having figured out how to make good transistor equipment.

Even forty years ago, tubes were still going strong.

Now if you'd said tubes were obsolete thirty years ago, that's far
more likely to get agreement. By then solid state had risen
sufficiently that no new tube based equipment was being introduced
(well, the exception being the output stage or stages).

There is all kinds of old parts lying around, waiting for that
day when someone would finally build that "dream rig". Of course
nodoby is going to be able to buy tube type components at their
local parts emporium, even if the local parts emporium still
exists), but then even forty or fifty years ago those who
had to buy off the shelf just like in the magazine article
often suffered, since they had to rely on what the magazine
article said and had to rely on what they could get at the
store.

But anyone who shows a certain level of capability can scrounge parts and make do with what they can find, so it's not particularly that big a deal that someone wants to build with tubes. IN a lot of cases, the parts are just waiting to be used, since others have declared them "obsolete".

It's kind of interesting that you dismiss building with tubes, but then turn around and suggest the solution is to modify a CB rig. Not that there's anything wrong with that, but someone wouldn't be building in the first place if the "wanted something already tested".

I can't give any specific advice about the USB interface, but I recall that there was a PC based spectrum analyser published in QEX within the last couple of years.

If you don't already, I would recommend subscribing to QEX, it's published quarterly by the ARRL. It contains a lot of leading edge technology. A Google search will give you more details.

As long as the mH choke is mounted at 90 degrees from either of the other inductors, you should be OK.

I am trying to think of ways to move you away from you current stalemate, hence the suggestion about using an Xtal osc for drive. Do you have access to a CB rig, ham rig, something that you can derive a few watts drive from, just to see if the unit is tuning as expected ?

I am quite intrigued about your 12V supply and diode to the Grid. It looks like the 33k should normally be at 0v and any -ve RF excursions are clamped at -12v, is that correct/what you intend ? Might be worth sticking a 100uA meter between the 33k and ground to allow you to check for grid current.

I do like the idea from one of the other contributors to check for jumps and hysteresis as you are cranking up Va while monitoring Ia. The two should move smoothly together, jumps are a possible indicator of instability.

I think 13.56Mhz may be the ISM band of choice if it is available in the UK, why did you choose 25Mhz initially ?

Any chance of pictures of the current hook up ?

Have you considered grounded grid ? the cathode coupling loop might only need one turn.

Is this a college/uni project ?

Regards,

Mark

Ive done a little with USB, so I'll add a little background if not
provide complete answers.

The first hurdle is the interfacing. You need a board with a driver
thats easy to interface with your host PC software program.
Ive used a board from www.mirrorbow.com for general control...you can
access it every 1mS and get 12 x 12bit ADC samples for each access, or
you can alter 8 bit digital ports etc. However, the speed is limited
to how fast the operating system can access the board, which is 1mS.
This board pretends to be a com port so it makes programming easier
without needing to include libraries and dlls etc.
Theres a board from National Instruments which I think is faster,
though only around 2.8Msamples/sec http://sine.ni.com/nips/cds/view/p/lang/en/nid/202596
And of course there are some dedicated USB spectrum analyser
available, but thats not the same as doing a home version.
So, you could just get a DAC board and go for it, though the speed you
can make a spectrum analyser is limited.

Of course you could use the superhet principle with a narrow band
filter and a programmable LO. You could then use a simple IO board
like the one from Mirrorbow to setup the LO, then use a peak detector
and the boards AD to give an indication of level. You'd then have a
digitally controlled analogue spectrum analyser, and you woudlnt need
the large sample rate.

Well, why don't you e-mail them and tell them what you read in your £350 law book. There are two e-mail addresses on their website. I'm sure they'd be delighted to hear from you as much as we are.

Better still, GET A JOB.

The state of USB has improved pretty dramatically in the past couple of years. The QEX article was a groundbreaker at the time, but the technology has moved on.

Presumably you are aware that a USB interface implies computation on both sides. The relatively recent USB PICs (18F2550, 4550, etc.) incorporate everything needed for the USB interface except the connector. Only a couple of years ago a USB controller chip was $26 and it needed a host of additional parts to actually implement the interface. A smaller USB PIC costs less than $5 and includes *everything*.

Go to http://ww1.microchip.com/downloads/en/DeviceDoc/39632D.pdf and take a look at the capabilities. To see it in an actual circuit, try
http://www.microchip.com/stellent/idcplg?IdcService=SS_GET_PAGE&nodeId=1406&dDocName=en529760
and download the users guide. The 2550 is the little TQFP to the right of the board picture, although it is available in a variety of packages, some more hobbyist-friendly then the tiny one on the board. The only additional part is an inductor to filter the USB voltage when it is used to power the target circuit.

This series of parts also includes A/D channels, tho they might not be the speed and resolution you want. The particular board is a nice one for experimenting because it includes one of the fast 16-bit parts that are easily programmable in a high level language, along with the USB interface.

Many thnaks for the heads-up on the PICs. I've always tried to avoid USB
interfaces for control applications, but I have a project on the horizon
where I will almost certainly go down that route - simply because laptops no
longer have RS-232 ports..

Yes, it was more common to see separates. ON the other hand, when
there were actual transceivers described, they did tend to use
common circuitry between transmit and receive. Solid state, because
of their size and low cost, has made it pretty easy to build
complete separates (minus the oscillators) in one box, which of
course does have the advantage of making switching pretty easy.

One advantage of separates is that it looks less daunting. Build
the receiver, and you have something finished, and even have it
for testing the transmitter. Then build the transmitter. The
overall product may require more work, but at least it's broken
down into more manageable pieces.

>
> I'd bet back issue reprints of QST articles are available from ARRL..
>
Traditionally, and I'm not sure why it would have changed, you could
get back issues for a reasonable fee, and if they didn't have any
of that issue, the specific article for a reasonable fee.

Of course, one can also get back issues on CDROM, and for someone
interested in the tube era, it might make sense to get a set from
the era when tubes were still pretty common in QST, but late enough
that things had developed well.

Old Handbooks of course not only have the construction articles, but
the peripheral information that might be needed by someone starting
to build tube equipment at this point. That 75metre SSB transceiver
that you mention, it showed up in a number of Handbooks in the early
seventies, and yes, it sure looked neat for an 11 year with his
first Handbook in 1971.

If this is a one-off project, you might even consider that particular board, depending on your requirements. The USB is used as a peripheral to the 28 pin part, so that from the bigger part you can simply do a printf() to communicate to your PC over serial. It relies on a Microcoft provided serial emulation driver. If your requirements are more demaiding, then you will need to really hit the books. Doing the USB software interface isn't real trivial.

mmmm ... I can see I should have been more explicit there, and maybe caught a couple of typos.

There are a number of USB classes with different capabilities. There is a serial emulation class, which Microsoft provides a driver for. It appears on Windows as a new serial port, and applications access it as if it were a serial port.

All USB devices must offer up a manufacturer code and a device code whenever they are first connected. The OS reads a .inf file to connect the particular codes to a driver. MicroCHIP provides an .inf file with the board that points to a MicroSOFT driver which does serial emulation.

When the 16-bit part wiggles it's USART, the PIC18F2550 catches that and sends it out over USB to the PC in serial emulation mode. The application on the 16 bit part must set up the baud rate for the USART, but beyond that, normal C I/O can be used, although it is pretty fat for many applications.

The documentation for the board says in comes with a dsPIC33FJ12GP202 but mine came with a PIC24FJ64GA002 -- more memory but no DSP engine. The board has jumpers to accept any 28 pin, 16 bit part. I've been doing most of my experimentation with a dsPIC30F012. The 30F parts are 5 volts, the others 3.3, and the 30Fs have a slightly different pinout. Jumpers deal with both, as well as deciding whether the board wants to be powered from the USB or a separate supply.

For a lower cost implementation, the 18F2550 and its cousins have plenty of gas to do more work, and Microchip does provide sample code for the USB serial interface, but I've always been a bit suspicious of Microchip sample code ... often it isn't quite as solid as one would hope.

NOPE, that is urban legend BS or must be working for a Far East exporter
(Purpose of the "weak dollar" is to strengthen these mfg. in world market -
not kill them).

Just in greater Chicago area there are at least 3 major mfg. that have been
around for 75+ years -- and turning out hundreds a day plus custom requests.
Triode Electronics JUST handles the Dynaco rebuild requests -- they are
providing brand new units exceeding original 1950 specifications (better
materials and mfg facilities)
http://www.triodeelectronics.com/

Heyboer - Grand Rapids, MI
http://www.heyboertransformers.com/index.shtml

Heyboer also handles the profesional musicians/bands/professional
restorers/audiphile market -- that still use vacuum tubes for that soft warm
sound!
http://www.heyboertransformers.com/tubeamps.shtml

There are a LARGE number of US transformer manufacturers -- USE the GOOGLE
with the Internet!!

> If you can find an old Heathkit HW32 (Monobander SSB series) and
> rebuild it that might work better.

Yes, that is a viable solution for a tube based radio. A solid state design
is also possible.

Does anybody have a good copy of Lloyd's VLF receiver as in
http://www.qsl.net/vk5br/VLFLFRx.htm
or know of a better link ..?
The schematic is of such low resolution that's impossible
to distinguish component values.

Thanks, Andrew.

I did that with a small solid state transceiver for 160 and 80 meters. The
mixers were DBMs. I think I wrote up the bilateral IF for Ham Radio,
but never got around to publishing the entire project..

I think that may have been the rig by Benjamin Vester (if my memory hasn't
messed up his name!) That was a cute project that always fascinated me.
At the time I was in my early teens and didn't have the skills to duplicate
it. Late 50s or early 60s IIRC.

That's it. It's in both the fourth and fifth editions of the SSB Manual.
Looking now, I see that it is listed as originally in QST for June 1959,
which seems terribly early. It looks like something that would have
been published in the mid-sixties.

What's surprising is how small it is. That sort of construction is
hard in itself, but at a time when people were still just getting
close to transistors it becomes amazing.

>>

I was vague about that because I'm not sure what I'm remembering. There
was an article in CQ about the "Argonaut", I think in the early sixties
but maybe late fifties, about this miniature SSB transmitter or transceiver,
and the DXpedition it went on (so maybe it was just a transmitter, to
get some new countries on the air on SSB, where there'd already be
receivers). It wasn't a construction article, but the intro mentioned the
consctruction details were published elsewhere. Either in the Bill Orr
Handbook, or the "Editors and Engineers" SSB handbook (which were either
Howard W. Sams, or would a tad later be engulfed by Sams).

But I'm not sure if that had subminiature tubes or not. Thinking about
it now, such a rig seems vaguely familiar, so maybe I did see the book it
was in at the Library in the early seventies when I started reading such
things. THere definitely is some memory that is stronger than that CQ
article, but I don't know what.

This may be a daft question, but is Marketing name for the product
"Inverter" ?

Doing a quick search on eBay, several ovens pop up with this name, one
description was "Panasonic Inverter Microwave Oven 1100W" - looks like
a 110V product to me.

I have never heard of a 12 or 24v microwave oven, 1100W at 24v = 45
amps which seems excessive even as a load for a large truck.

Regards,

Mark

Conventional microwaves control the power by ON/OFF cycling of
the oven. For example, 1/2 power might be 5 seconds on, 5 seconds off.
The inverter technology controls the actual klystron operating voltage
to set the power level, and the food is heated continously. I'd suspect
the variable power feature has horrendous artifacts on the supply
voltage making it completely unsuitable for use by hams.

1993. HF finals from PC monitor boards?

Newsgroup: rec.radio.amateur.homebrew
Date: 2007-07-29 17:35:02 UTC
From: spamhog@gmail.com

Source record: 6984

In the vacuum tube world,
several types of TV line finals
are reused as HF PA FINALS.

- WHAT ABOUT CRT-TYPE PC MONITORS? -

Are there solid state components there
that could do say 5 to 30W (in) at HF?

Any other components
that would fit well
in a basic CW TX?

I'd be moderately surprised if that were not the case!

Hints, anyone?

I think if you do some serious searching you find there are literally
HUNDREDS of
simple kits available for any ham who wants to build his own equipment. From
sophisticated transcievers to tiny TunaTins, PSK-31 transmitters, and
a few simple software defined
rigs thrown in for good measure. I don't see the need for what you're
proposing, and the market would have filled the gap if anyone else did.

I think you'll find the big power transistors are the horizontal
output transistors, and they have very limited frequency response.
Barely up into the HF range. Not really a surprise, given they
are intended for tens of KHz useage, and nothing more. They may
also have extraneous components built in, that may get in the
way of other useage. And there may be limits on their useage
in non-pulse applications, just as sweep tubes from years ago
had limitations in linear use.

Any other power transistors may also be limited in frequency. On
the other hand, other than the horizontal output transistor there
isn't really anything special about the power transistors in a
monitor. I suspect your chance of finding suitable transistors
are just as good in any piece of consumer electronics that would
have power transistors. So it's more a case of looking in those
scrap printers and those switching supplies and even audio amplifiers,
and looking up the power transistors in the databooks to see if
they have any good frequency specs.

In the old days, tv sets were one of the few consumer electronic
equipment around, those and radios. So if you wanted to scrounge parts,
you had to go for tvs and radios. The former, if they had an
actual transformer in the power supply, could supply a nice
hefty transformer and that was likely a bigger key component
than the tubes.

Now, there is an awful lot more consumer electronics out there,
in quantity and variety. And of course, it gets scrapped. So
there is a lot more chance to find parts of the common variety.
There was nothing all that unique about tv sets, other than they
were available.

Of course, sweep tubes were used in commercial ham equipment because they were cheap because they were used in a lot of tv sets. So long as transistors aren't exotic, they tend to be far cheaper than tubes were, and buying them is as easy and cheap as trying to find suitable HF transistors in consumer electronics.

> Any other components
> that would fit well
> in a basic CW TX?
>
Any consumer electronics will supply lots of capacitors and resistors and garden variety small signal transistors. They may supply some power transistors suitable for transmitting, but that would depend on what is used. Some consumer electronics will still have transformers, and those are worth grabbing. Filter capacitors for the power supply. A lot will supply various crystals and/or crystal oscillators, though chances are good their frequencies won't be in an actual ham band. Of course, find enough crystals on the same frequency and you can start making ladder filters. Lots of LEDs, and various switches (though pushbottons are more common in some areas than toggle switches). Pull a VCR or tv set, and you'll find tuner modules that may be useful in other things. Any old am/fm radio will have a multi section variable capacitor, just like the old days, though likely the newer the radio the more likely they use varactors instead. All the audio amplifier ICs you can want, be they in radios or on soundcards or modem cars. It just goes on.

But other than the variable capacitors, few of the parts will be especially exotic. If you need really high frequency transistors, you'll have to look for things like satellite tv receivers. Though, I once got some Mosfets out of FM preamps for car radios. The average am/fm radio will supply ceramic filters, "narrow" at 455KHz, wide at 10.7MHz. Find the legendary ssb CB sets in the garbage, and that should supply a decent filter for SSB, but otherwise you aren't likely to find narrow filters in consumer electronics. Cellphones, the older and clunkier the better since they will have useable components, are a treasure trove of parts, including roofing filters in the range above 30MHz, and usually a 455KHz narrowband FM IF strip, complete with a crystal to move from the roofing filter frequency down to 455KHz. But those narrow filters will still be too wide for even AM. Cordless phones offer up 10.7MHz and 455KHz ceramic filters for FM use, and again the needed crystal to get from one IF to the other. You can often extract the IF strip as a module and use it intact. They often use identifiable Motorola FM IF strips, that can be reused in some other uses. At the very least, they are a source of "gilbert cell" type mixers.

In the old days, if you wanted exotic components, you had to go for surplus. Because no consumer electronics would have those needed SSB filters, or even crystals to make your own filters. That's changed, a lot more variety is available in consumer equipment.

But likely no matter what you are building, unless it's relatively simple, you will always find some component that you can't scrounge.

yes, there are appaently 2 types, one is made to run off of 12 volts maybe
24 VDC and the other runs off of 120VAC.
I think the 120VAC initially converts it to 300VDC then aplies it to the
inverter circuit.. Still trying to find a schematic to verify. I would think
this technology could be a major help for amp builders allowing us to build
inexpensive power supplies and easily custom wind the inverter transformers.

check the video finals, usually they can
supply a few watts in the HF range :)

Why don't you try one and let us know? It might just need additional
filtering
if they are using some sort of pulse width control of the klystron duty
cycle.
I was just expressing an opinion. My kitchen microwave is a Panasonic
inverter type.

Hi. I'm sorry if this is off topic here but I thought some of you would know.

I'm looking for a small portable battery operated AM/FM radio to bring with me on hunting/fishing trips, so I guess what I'm looking for is a radios with a strong receiver to catch as many station as possible. I'm not looking for better sound, just a basic radio I know any radio won't work if you are too far away, but that won't be my case. with the radio I have now , I can catch like 1 FM station whenb weather permits, and 4 or 5 AM stations,... I would like to increase these numbers as much as possible..

Can you recommend a good brand/model please?

regards
stef, Montreal, Canada.

Please dig out the ones you have and take photos, front and rear of the
entire unit and if you don't mind, disassemble and photograph and
components. I can host the photos if you wish (email them to me).
This would _really_ help in the evaluation until any of us find schematics.

Somehow I seem to remember an early commercial 'radio oven' that used
a klystron; can anyone confirm this?

Please post photos of it together with make and model info; if you
feel frisky, photos of the interior and PCBs would also be helpful
together with a photo of the wiring-diagram label that is often
included.

Wish i could, i dont even have one of them now. wife said i couldnt tear them up and donated one to a church and we are using the other. i noticed i can get the service manual for a few bucks and will probably do that, i was hoping i could find one for free. Sometimes sevice manuals dont go into that much detail. though.

i thought i did post the model #. dont know what happened. will have to dig it out again. Wife got a hold of them and gave one to the church and one became our personal oven so i cant tear it apart. I have long since been forbidden to do that unless it is really broken.

Thank you all around!

I went through a couple of display motherboards, and looked into the specs of all power devices.

What their applications have in common is being rather high current and low frequency. You don't find much rated to work beyond fery few MHz, and with very large capacitances.

Examples:

- power MOSFET capable of switching 600V, 10A peak, with 2200pF gate-drain capacitance

- bipolars that can absorb several watts, but no higher than a couple of MHz

- horizontal finals yjat are included in fairly complex ICs with lots of ancillary components in feedback and protection circuitry - at least in CRT VDUs from the last 10+ years.

I have no doubt some RF can be teased out of these, but it seems to me it would be at the price of major design complications.

The advantage of tube finals was that their high-voltage low-current and low-capacitance nature lent itself to functioning also at higher frequencies than those of typical video circuits.

Next I'll look into TV distribution amps. I remember that transistors in those were designed to linearly pump a lot of different signals up to UHF, and that they tended to run hot - and 24/7.

Look at RF transistors from the surplus houses if you want to save
bucks. Up to 10MHz or so you can use MOSFETs designed for SMPS service
if you're careful with the gate drive circuit, and they'll be dirt cheap.

Brand spanking new transistors that'll handle a few watts at HF are a
couple of bucks each, you can get up to 10W out affordably -- why do you
want to muck around parting out consumer electronics of uncertain
provenance?

Many products still use RS-232 (albeit at TTL voltage levels) internally and just use, e.g., an FTDI USB<-->RS-232 converter chip (such as the FT2232R). This is actually easier than using a USB microcontroller, although it does tend to end up being a little more expensive as well (i.e., $5 for the FTDI IC, $5 for a microcontroller vs. $5 for a USB controller).

curiosity and hack value, not much else!

there are good transmitter kits that are worth more than the effort
(and cost too) of ordering ones of each component

if you have some junk, though, it may be worth a thought :-)

Next consideration....not having to hand any components or
experience of the broadcast TV band (0.4 - 1GHz?) I wonder
what tuners and mixers are fitted to modern TVs and if anyone
can recommend a tuner separate from a main board that
might be used.

Also, where tuners are driven by I2C and similar busses, are
they channelised to fit the standard TV channels, or do they
have a delta frequency, say, 10kHz, that might be useful
for a spectrum analyser?

The HW-101 (OK, it had a couple semiconductors in it but I won't hold
it against it, it's still a "tube rig") was still for sale by Heathkit
up till 1980 or so.

That'd be 27 years ago.

Tim.

A few years ago at FDIM, George Dobbs did a presentation about some guy whose main interest in the hobby was making complete rigs from PC monitors. He strenuously avoided using any parts that couldn't be scavenged from a monitor, so obviously, his designs were a little unusual. Getting in contact with George if you're not in the UK can be an exercise in frustration, and I don't recall the call of the guy he was talking about, or even the country, for that matter (I think it's the brains leaking out that's turning my hair gray).

I think it would have been in the 2005 FDIM proceedings, possibly 2003, but I think 2005.

Because it is off topic.

I'm tired of newsgroups being cluttered with posts that belong elsewhere.
And most of the time it is because people can't be bothered finding
the most appropriate place to post.

There's a whole rec.radio.* hierarchy, yet you chose to post in one
about the building of amateur radio equipment. That doesn't say much.

Asking in the local newsgroup would actually be more on topic than
asking here.

Lots of examples of IRF520 MOSFETS and similar in HF output stages and
amplifiers out there, monitors also tend to have nice stuff like HV
caps, ferrites and as another poster mentioned, the video circuitry on
the tube base (often) has some nice transistors that will work up to
VHF.

Spirit of experimentation? I thought homebrew was all about that,
nothing like being able to tell a contact that the TX was built out of
scrap you got for free.

And, it's not a STEENKIN chat room. The thousands of amateur radio operators that follow this ng aren't following the postings on a minute by minute basis.

What made the OP think that The Answer -- much less _any_ answer -- should be forthcoming in an hour or two? It's probably _days_ before a majority of rrah participants read any individual post.

Now, with the selfish, whining followup by the OP to his own post, there will be doubtless _far fewer_ , if any, followups by folks who might've had a good recommendation (even tho' it's OT.)

I doubt this - the vertical output is in an integrated IC, but the horizontal output is normally just a transistor, often with a built-in diode across the collector-emitter, but in the direction such that it won't bother you in any sensible circuit. They are mostly pretty slow, since they're high voltage.

> I have no doubt some RF can be teased out of these, but it seems to me
> it would be at the price of major design complications.
Or you could say that you would get a sense of accomplishment when you've succeeded. Some of the transistors are mot so bad - e.g. I got a few 2SB772 (PNP) and 2SD882 (NPN) (10-Watt 30V, 3A, fT>80MHz) transistors out of a monitor, that'd be OK for a QRP transmitter I think.

> The advantage of tube finals was that their high-voltage low-current
> and low-capacitance nature lent itself to functioning also at higher
> frequencies than those of typical video circuits.
I did find a 2SC3675, which has an output capacitance of only 2.8pF and a VCEO of 900V. It is slowish (fT=6MHz), so I might use it as a cascode in a high voltage audio amplifier for driving electrostatic headphones.

The video amplifiers in a monitor have to be pretty fast for high resolution signals, and often these are discrete transistors to handle the power. I got some 2SC2682 devices out of monitors - 180V, 3.2pF, fT=200MHz, 10W - a few of these could make a useful amount of RF, I reckon.

> Next I'll look into TV distribution amps. I remember that transistors

Stef in Montreal

This is the Amateur Radio "Homebrewing" focus group. So to bring your request a bit more "on-topic", why not design and build your own radio equipment? Think of the fun and sense of satisfaction you could get from using a radio set that you have designed and built. It's easy...we do it all the time.

----

to Arv - K7HKL , thank you for your suggestion. Right now I can't really commit on building/studying a radio. But thank you very much for being kind, willing to help, and for your Proactive attitude.

And please people, may this tread die right now so no one else (not including you sir) get irritated by my diabolic mistake ..

Regards

Stef.

For FM in remote areas you'll need an external antenna, like a
telescoping whip. For AM you most likely won't need an external
antenna, I've heard AM stations from a thousand or more miles away late
at night all snuggly in my sleeping bag.

Take a look at
http://www.ambientweather.com/mi300wobare.html
It does more than just AM and FM but it's only $26 and available in five
colors.

Something like
http://www.ambientweather.com/etgrframrafl.html
never needs batteries and can charge up your cellphone at the price of
$50 and some elbow grease.

The Grundig/Eton brand has never disappointed me, you may want to try
rec.radio.shortwave as suggested for more in-depth suggestions.

Enjoy!

2032. Radio reception gone wacky

Source record: 6874

Sorry for the hiatus, I had an exam to submit over the weekend and work is being a time hog at the moment.

Re something with a few watts of drive, I do have a couple of ham friends, who might be able to provide this if I brought the project to them. Only problem is that the power supplies et al are spread over the workshop at the moment, but this might be a good route if I cant get any further. It has occured to me that I might have broken the tube, melted the grid or something, so this could prove the tube works.

I have studied up on the tube capacitances and the interaction in the circuit, and decided to rework the project into a different design - either hartley or colpitts. Have come across a patent also that describes exactly what I want to do (tube amp for plasma excitation), and they use a modified hartley. But looking at the colpitts, I like the way that the tube capacitances are in parallel with the tank caps. They should swamp the tube values I think.

Re the 12V supply, the idea is that the resistor biases the grid (at DC) to ground, the cap smooths the current through the resistor, and as electrons flow into the grid and make it more negative, at 12V the diode starts to conduct and clamps the DC grid bias at -12V. Of course, the tube end of the grid circuit is being driven high and low by the coil, so this shouldent clamp the grid voltages - just the grid DC level (bias). Thats the idea anyway - might be missing something. I have checked grid current and it peaks at about 50mA with the voltage cranked up to about 2kV IIRC.

Re choosing 25MHz, I originally was shooting for 50MHz but had no joy getting the circuit to work. It worked great at 5 MHz or so, so I felt a compromise would be 25MHz. So thats where I am currently aiming for. The higher the frequency the less reactance I will get from the 'load' if I drive it capacitvley which is what I want to do (because of striking the discharge, which is difficult to do inductivley). There is a need to seal the plasma tube for certain experiments to raise the pressure in it, and some of the substances I wish to excite are not compatible with metals (an example is sulphur, which is a major part of the experiments, and its performance is described in various patents - its usually excited with microwaves in the current art, but I want to use very small discharge chambers which make this hard) so I cannot have any metal in the discharge envelope (I also have the kit onhand to make these quartz glass capsules).

As you say I have heard of 13.56MHz also as a standard frequency for this kind of work, but I am aiming higher for the above loading

reasons.

Now, as for grounding the grid, I have considered it, but have not come across any designs of oscillators where the grid is grounded, and I dont have enough confidence in my circuit redesign skills to work out the details myself. I could of course work out the circuit, but what Z will be where, and how is this related to that phasewise - an example is the increased capacitance from the anode to the case (which is now the grid). Just dont know.

I will get some photos of the rebuilt thing once its a colpitts, I am also replacing the caps with some homemade ones made from heavy copper foil, since I am a bit unsure of the quality of the russian doorknobs I am currently using.

Finally, is this a uni project - well, not yet, but I am a physics undergrad and am studying some related fields, so you could say its related. It also relates to some harder core physics experiments I want to start soon, with a cyclotron being one project, which I need powerful RF drive for. Its all great fun - unless you cant get your damn RF power house to work!

Current interest for this project relates to finding a discharge lamp (high intensity) whos spectrum compliments the zooanthellae photosynthesis absorbtion of marine corals. I could write a ream about this but its off topic so I will leave it at that for the moment. But its a means to an end currently - although I would like to have a power oscillator capable of spanning 1 to 100 MHz at several hundred watts for plenty of other experiments.

Thanks for the contributions so far. Hope to nail this one soon.

2034. A new use for dental floss
